E-mail: William.W.Yu@sce.com

Dated: **August 17, 2026**

BEFORE THE PUBLIC UTILITIES COMMISSION OF THE STATE OF CALIFORNIA

Order Instituting Rulemaking to Modernize the Electric Grid for a High Distributed Energy Resources Future.	Rulemaking 21-06-017

GRID NEEDS ASSESSMENT AND DISTRIBUTION UPGRADE PROJECTS REPORT OF SOUTHERN CALIFORNIA EDISON COMPANY (U 338-E)

PUBLIC VERSION

Pursuant to California Public Utilities Commission (Commission or CPUC) Decision (D.) 24-10-030 and previous Administrative Law Judge Rulings on Distribution Investment Deferral Framework reforms, Southern California Edison Company (SCE) respectfully submits its 2026 Grid Needs Assessment and Distribution Upgrade Projects Report (GNA/DUPR), along with supporting documents, in **Attachments A through I**. Please note that SCE will be separately submitting its Final Independent Professional Engineer (IPE) Plan, as it was provided too late for inclusion in the GNA/DUPR submission.

As contemplated by the Administrative Law Judge's Ruling Addressing Pacific Gas and Electric Company, Southern California Edison Company, and San Diego Gas & Electric Company's Claims for Confidential Treatment and Redaction of Distribution System Planning Data Ordered by D.17-09-026 and D.18-02-004, dated July 24, 2018, and Section 3.3 of General

Order 66-D, SCE is concurrently filing a motion to submit under seal unredacted versions of these materials, based on customer privacy considerations, as set forth in the Declaration of Christopher Ohlheiser, attached to the motion.

Respectfully submitted,

WILLIAM YU

/s/ William Yu

1. Executive Summary

Southern California Edison Company (SCE) hereby submits the narrative for its 2026 Grid Needs Assessment (GNA) and 2026 Distribution Upgrade Project Report (DUPR) as directed by the California Public Utilities Commission's (Commission or CPUC) Decision (D.) 24-10-030 and previous Administrative Law Judge (ALJ) Rulings on Distribution Investment Deferral Framework (DIDF) reforms.[1]

The GNA presents forecasted load and distributed energy resources (DER) planning assumptions, as well as the identified distribution and subtransmission needs that fall under one or more of the four distribution services: capacity, voltage/reactive power support, reliability (back-tie), and resiliency (microgrid). The DUPR presents SCE's planned investments and solutions that address grid needs identified in the GNA report. For this 2025-2026 planning cycle, SCE conducted three scenario assessments and is providing each scenario's GNA and DUPR. One "final" GNA/DUPR represents the synthesis of the three scenario-based considerations. Thus, four GNAs and DUPRs are provided in total, and to streamline the presentation, each related GNA/DUPR is paired into a single report.

As discussed in detail later in this document, SCE has identified 1,885 grid needs and 1,357 planned investments and solutions[2] in its final 2026 GNA/DUPR.

2. Background and Regulatory Requirements

On August 14, 2014, the CPUC established Rulemaking (R.) 14-08-013, which set forth guidelines, rules, and procedures directing California's Investor-Owned Utilities (IOUs) in the development of their respective Distribution Resources Plans (DRPs). On February 15, 2018, the Commission issued D.18-02-004, which directed IOUs to file a

2 Note that there are more rows of data in the DUPR planned investment sheet than there are projects. Some projects have multiple rows of data.

GNA report and Distribution Deferral Opportunity Report (DDOR) on an annual basis.[3] On May 7, 2019, the Commission issued the 2019 DIDF Ruling,[4] directing IOUs to file both the GNA report and DDOR on August 15 annually.

On July 2, 2021, the CPUC established Rulemaking R.21-06-017, which set forth a broad scope of topics that would guide the California IOUs to modernize the grid for a high distributed energy resources future. On October 23, 2024, the Commission issued D.24-10-030, which directed IOUs to eliminate DIDF solicitations and the DDOR, and to focus on improving transparency of the Distribution Planning Process (DPP) through reporting.[5] The DDOR was replaced with the DUPR, which would follow the same reporting requirements as those established in a June 21, 2024 ALJ Ruling.[6]

In December 2025, the Commission adopted Resolution E-5413 (Pending Loads) and Resolution E-5414 (Scenario Planning), which establish additional requirements applicable to the 2025–2026 Distribution Planning and Execution Process (DPEP) cycle and this GNA/DUPR filing.

Resolution E-5413 requires utilities to implement a standardized pending loads framework, including the categorization, tracking, and reporting of pending loads in the GNA and DUPR, and to describe how changes in pending load assumptions are incorporated into grid need identification and planned investments.[7]

Resolution E-5414 requires utilities to adopt a scenario planning framework based on Low, Base, and High load growth scenarios and to incorporate the results of those scenarios into both the GNA and DUPR. The Resolution further requires utilities to develop and report a transparent decision logic framework describing how multiple scenario outcomes are translated into a single set of planned investments included in the DUPR.[8]

Together, these resolutions implement the directives of D.24-10-030 by enhancing transparency in how utilities incorporate pending loads, evaluate uncertainty through scenario planning, identify resulting grid needs, and develop planned investments. The resulting framework provides greater visibility into the assumptions and methodologies used to translate forecasted load and DER growth into the GNA and DUPR.

The GNA presents the grid needs identified throughout SCE's distribution and subtransmission systems that fall under one or more of the four distribution services adopted by D.16-12-036. It also includes load and DER forecast

8 Resolution E-5414, 585850473.PDF

components for distribution circuits (or "feeders") and distribution substations with voltage levels of 33 kV and below in SCE's service territory. For the 2025-2026 DPEP cycle, the DUPR presents SCE's planned investments, planned solutions, and conceptual scenario solutions that address scenario-based grid needs listed across the respective GNAs and the final synthesized version.

SCE includes the following information in its 2026 GNA/DUPR filing (organized by scenario where applicable):

- GNA Results - Distributed Energy Resource Growth Forecast
- GNA Results - Demand Forecast and Bank/Feeder Capacity Needs
- GNA Results – Reliability/Resiliency Needs
- GNA Results – Scenario Forecast
- GNA Results – Bank/Feeder Capacity Needs
- DUPR Planned Investments
- DUPR Planned Solutions
- DUPR Scenario Analysis Projects
- Project Execution Metrics
- Pending Loads Tracking Data
- Known Load Reporting and Metrics

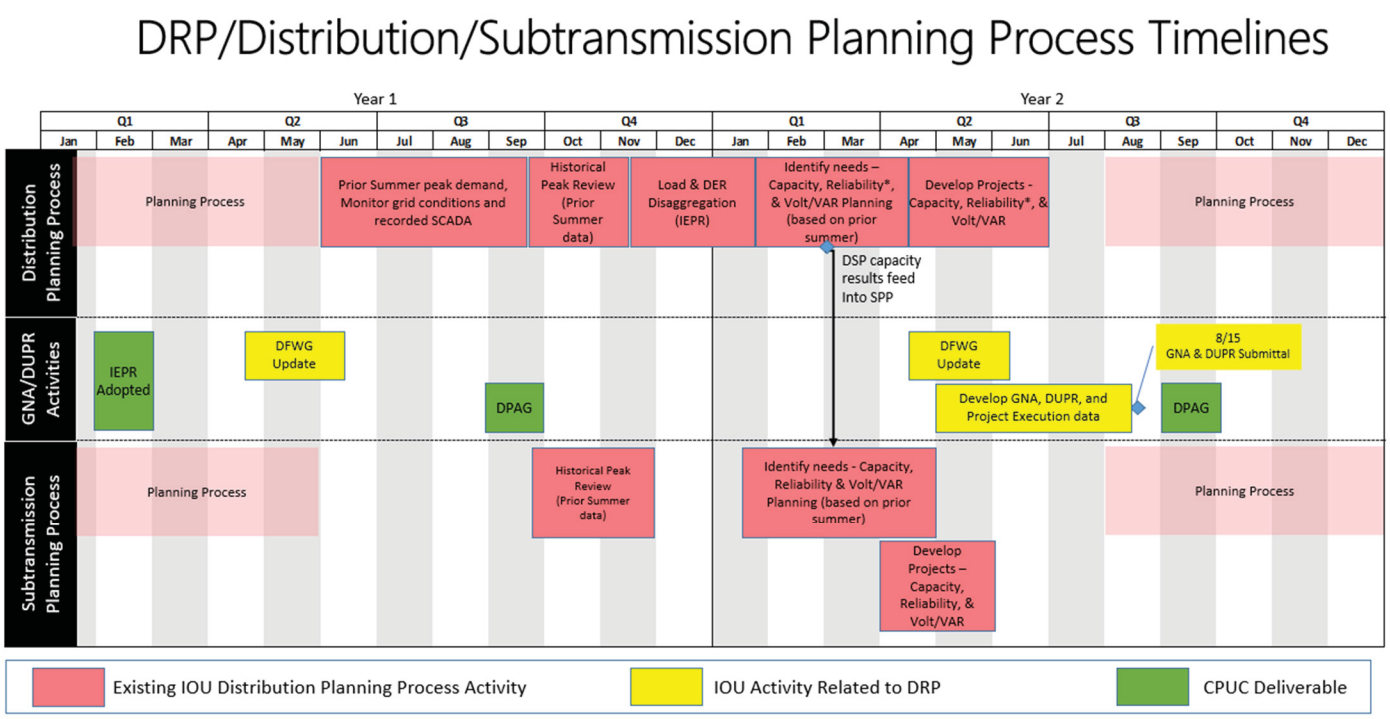
The GNA and DUPR are required to be filed annually with the CPUC each August. For 2026, it is due August 17th.[9] The associated data is required to be published to the Distribution Resources Plan External Portal (DRPEP) by August 30. The filed reports are subsequently discussed through the Distribution Planning Advisory Group (DPAG) process, with meetings typically occurring in September of each year.

3. Distribution Planning Process Overview

SCE's typical timeline for major DPP activities and its integration with the GNA report and DUPR is displayed in Figure 1Figure 1. Please note this timeline may not reflect SCE's exact annual DPP schedule. The timing of these major activities could vary depending on when SCE's distribution system observes its peak loading conditions. Additionally, advancements in software tools and changes to regulatory requirements may also influence this process.

[9] R.21-06-017, Administrative Law Judges' Ruling Setting Schedule for the 2026-2027 Distribution Planning and Execution Process Cycle, Apr. 20, 2026, p. 5.

FIGURE 1: DRP/DISTRIBUTION/SUBTRANSMISSION PLANNING PROCESS TIMELINES



* Evaluated on case-by-case basis
Note: Task Durations are estimates and subject to change

3.1. Historical Profile Review

Most of SCE's service territory experiences peak demand during the summer, typically from early June through September, with occasional extensions into October.

After the summer peak season, engineers review the recorded demand profiles of each distribution circuit to identify any abnormal conditions,[10] which are then adjusted or replaced to reflect normal conditions. The cleansed circuit demand profiles are aggregated to develop substation demand profiles. These demand profiles are used to establish the baseline demand for each circuit and substation, to which load and DER growth forecasts are added to develop a long-term forecast (at least 13 years).[11]

---

[10] Examples of abnormal conditions include but are not limited to temporary circuit reconfiguration during emergency outage scenarios or to perform planned work such as new equipment installation, repair, or replacement.

[11] SCE views this as consistent with D.24-10-030 OP 5: "Beginning with the 2025-2026 Distribution Planning and Execution Process, Utilities must extend the distribution planning forecast horizon to a minimum of 13 years and extend planning horizons to a minimum of 10 years. Utilities shall maintain the current minimum three-year horizon for line section analysis."

3.2. Load Growth Allocation and DER Forecast Disaggregation

The California Energy Commission's (CEC) Integrated Energy Policy Report (IEPR) provides forecasts at the SCE system level and does not provide the granularity needed for planning localized distribution and subtransmission assets. SCE and stakeholders participate in the Distribution Forecasting Working Group (DFWG) workshop on an annual basis to discuss methodologies for disaggregating system-level load and DER forecasts to the distribution circuit level. As noted within the DFWG Report, "SCE also incorporates additional load growth that may not have been fully reflected in the CEC forecast."[12]

3.2.1. Load Growth Allocation and Integration Process

SCE's load allocation and integration process begins with the IEPR forecast, supplemented by local area knowledge from system planning engineers on new and planned development projects and econometric data for each planning area.

System planning engineers coordinate with developers across agricultural, commercial, industrial, residential, and transportation electrification sectors to assess the electrical demand, location, and timing of upcoming known Load Growth Projects (LGPs). This process enables engineers to estimate the projected increases in demand on distribution facilities based on developer provided information, project progress, and historical experience from similar developments.

Consistent with recent CPUC requirements, SCE also incorporates "pending loads" into its forecasting process. Pending loads represent forecasted demand that is more certain than econometric trends reflected in the IEPR forecast but less certain than completed customer energization requests. These loads are identified through ongoing customer engagement, planning studies, and publicly available information, and are categorized based on the level of certainty associated with their location, timing, and magnitude. Incorporating Pending Loads supports a balanced approach to infrastructure planning by tying upgrades to likely customer requests, reducing the need for broad capacity investments while minimizing the risk that customers experience interconnection delays or are unable to connect when service is needed. While LGPs are evaluated at the customer-project level, most are assumed to be represented within the IEPR forecast and are incorporated through the standard load allocation process rather than as incremental additions. However, the IEPR forecast does not capture all types of load growth that SCE needs to plan for. Temporary Power LGPs (short-term heavy construction loads), Firm Battery Energy Storage System LGPs (dedicated charging capacity), and Wholesale Distribution Access Tariff (WDAT) LGPs (served via the CAISO-controlled grid through the utility distribution system) are not fully represented. Loads from these categories are incrementally added to the IEPR forecast and included in SCE's overall load growth forecast. Additional details on the long-term load forecast are provided in Section 4.

3.2.2. DER Forecast Disaggregation Process

The IEPR provides a 15-year forecast for key DERs: energy efficiency (EE), transportation electrification (TE), solar photovoltaic (PV), energy storage (ES), and fuel substitution (FS). In general, EE and PV reduce net demand; TE and

---

[12] Joint-IOUs and Itron, "*Distribution Forecasting Working Group Progress Report*," July 2, 2018 (*available at* http://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M229/K731/229731972.PDF), p.97.

FS increase net demand; and ES reduces net demand during discharge periods and increases it during charging periods.

For non-TE DERs, SCE disaggregates IEPR forecasts from the system level to distribution circuits. For TE, SCE first removes the portion associated with LGPs and disaggregates the remaining IEPR forecast. The resulting DER impacts are incorporated into circuit- and substation-level net demand forecast, which serve as inputs to the annual DPP. Additional details on this methodology are provided in Section 4.

3.3. Identify Electric System Needs

The developed net demand forecasts are input into planning software as the Normal Projected Load (NPL), based on an average (1-in-2) temperature assumption. The NPL is then adjusted to the Criteria Projected Load (CPL) using a 1-in-10 weather assumption specific to each asset location. Engineers evaluate whether the forecasted CPL can be served by existing facilities within their Planned Loading Limits (PLL) or Emergency Loading Limits (ELL) in the case of reliability-constrained system conditions (such as the forced outage of a transformer bank).

Consistent with CPUC requirements, SCE performs these assessments under a scenario planning framework, evaluating system conditions across three scenarios (Low, Base, and High) to reflect uncertainty in load growth. This approach enables engineers to identify a range of potential system needs and better understand the likelihood and timing of capacity constraints.

Before proposing system upgrades and new infrastructures to mitigate identified needs, engineers first maximize the use of existing assets through no-cost or low-cost solutions (e.g., load transfers). Each scenario-based GNA will reflect the grid needs before these measures have been applied. The final GNA associated with the synthesized analysis will reflect the grid needs after the measures have been applied.

3.4. Develop Projects to Solve for Electric System Needs

As part of the DPP, SCE develops investment alternatives to address grid needs that cannot be resolved through no-cost or low-cost solutions. Engineers evaluate solution options in order of increasing cost, including:

- Modifications to existing distribution circuits;
- Construction of new distribution circuits;
- Substation expansion; and
- Construction of new substations.

Consistent with the CPUC scenario planning framework, these alternatives are evaluated across multiple demand scenarios (Low, Base, and High) to assess how system needs may vary under different load growth outcomes. This approach enables SCE to identify solutions that perform reliably across scenarios, consider the likelihood and timing of constraints, and prioritize investments that maintain system reliability while managing the variability in load growth.

For each need, SCE develops multiple alternatives and evaluates them based on reliability, operational flexibility, and cost-effectiveness. Options that do not meet technical or planning criteria are eliminated, and a preferred solution is selected from the remaining feasible alternatives.

4. In-Depth Forecast Methods

SCE presented the selected IEPR scenarios (Table 1) and its Load and DER disaggregation methodologies for the 2025-2026 DPP to the DFWG on May 19, 2026. The purpose of the DFWG meeting was to vet the methodologies and data sources used in the disaggregation process to ensure that circuit level forecasts apply the best available data sources and incorporate stakeholder feedback for future planning cycles.[13] This section provides additional details that support and expand upon that presentation.

TABLE 1: 2024 IEPR SCENARIOS FOR DISTRIBUTION PLANNING (2025-2026 DPP/2026 GNA-DUPR)

Local Reliability Scenario – Adopted 2024 IEPR	
Forecast Name	**Scenarios**
Economic, Demographic, and Price	Baseline Forecast
BTM PV and Storage	Low
Additional Achievable Energy Efficiency (AAEE)	Scenario 2
Additional Achievable Fuel Substitution (AAFS)	Scenario 4
Additional Achievable Transportation Electrification (AATE)	Scenario 3

SCE is transitioning from a point-based forecasting approach to a fully profile-based forecasting approach. During this transition period, forecast development includes reviewing and cleansing load profiles, allocating and integrating load growth, disaggregating DER forecasts, and developing net demand forecasts at increasingly granular planning levels. These activities support a more detailed representation of forecasted customer demand and DER impacts across the distribution system. SCE continues to refine its forecasting methodologies and processes to improve the accuracy, consistency, and transparency of the DPP.

4.1. CEC System Level Forecast Adjustments

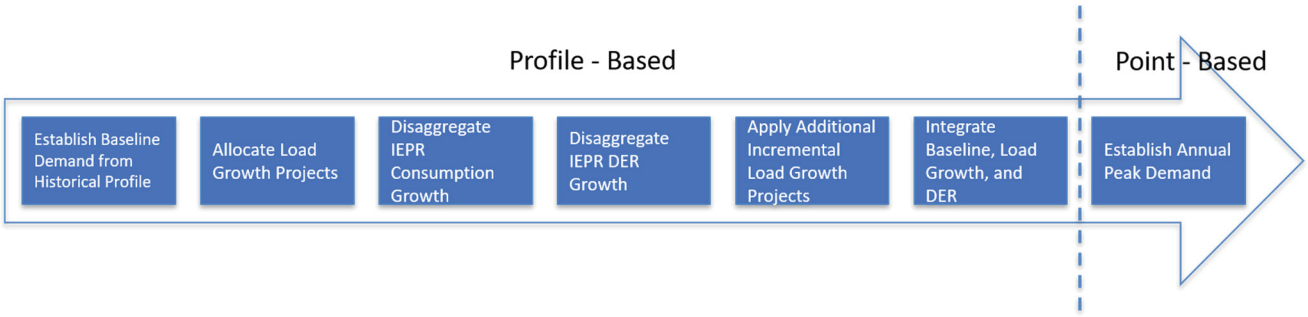
SCE obtains annual consumption and DER forecasts from the CEC's California Energy Demand Forecast and extracts the Transmission Access Charge (TAC) area forecast values for the planning horizon. SCE then applies a loss ratio and TAC-to-SCE system ratio, derived from the IEPR forecast data, to adjust the TAC area forecast to align with distribution planning needs. The resulting forecast values are used as control totals for DPP disaggregation.

4.2. Distribution Demand Forecast Process Overview

This section provides a high-level overview of SCE's distribution demand forecasting process, summarized in Figure 2 and described below.

[13] Joint-IOUs and Itron, "*Distribution Forecasting Working Group Progress Report*," July 2, 2018 (*available at* http://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M229/K731/229731972.PDF)

FIGURE 2: SCE'S END-TO-END DISTRIBUTION FORECAST PROCESS



1. *Establish Baseline Demand from Historical Profile*:
   Baseline demand profiles for distribution structures are developed using regression based on cleansed 8760 historical profiles and are adjusted to reflect an average (1-in-2) temperature assumption.

2. *Allocate Load Growth Projects:*
   LGPs are allocated to distribution structures based on their classification (e.g., known loads and pending load categories) and incorporated according to the CPUC's scenario planning framework and IEPR cap and hot spot logic.

3. *Disaggregate IEPR Consumption Growth*:
   The remaining IEPR consumption forecast is disaggregated to the distribution structure level using econometric models, incorporating demographic, economic, and land-use drivers not captured through LGPs.

4. *Disaggregate IEPR DER Growth*:
   IEPR DER forecasts are disaggregated to the circuit level using a common disaggregation framework. Where applicable, portions of the IEPR DER forecast associated with LGPs (e.g., certain transportation electrification segments) are first accounted for through the LGP allocation process in Step 2; the remaining forecast is then disaggregated using analytical methods.

5. *Apply Additional Incremental Load Growth Projects*:
   Limited incremental LGPs not captured in Step 2 are incorporated into the forecast after IEPR load and DER disaggregation. These projects represent incremental adjustments that IEPR forecast doesn't account for, which helps to ensure the forecast reflects the planning needs.

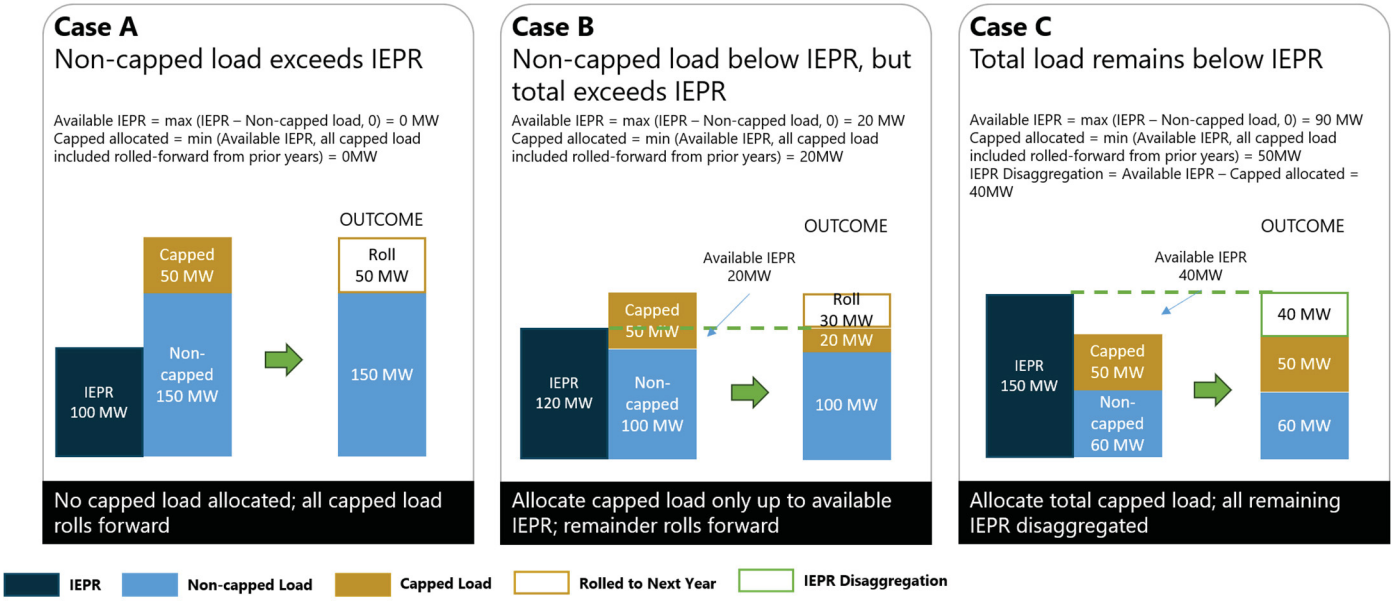
6. *Integrate Baseline, Load Growth, and DER*:
   Baseline demand, allocated LGPs, disaggregated IEPR consumption and DER forecasts are combined. Hourly profiles are applied to develop an initial 8760-hour net demand forecast for each circuit. The resulting forecast reflects total demand, including both baseline conditions and growth. Profiles used include DER-specific shapes and representative sector load shapes (e.g., residential, commercial, industrial, agriculture, and transportation electrification).

7. *Establish Annual Peak Demand*:
   Circuit peak demand is identified from the integrated hourly net demand forecast, and coincident load and DER impacts are determined based on the circuit peak hour.

4.3. IEPR Cap Logic and Scenario-Based Forecast

SCE applies IEPR cap logic in accordance with the CPUC Scenario Planning Resolution (E-5414) to help ensure that forecasted load growth remains aligned with the CEC IEPR while appropriately reflecting levels of certainty in load growth projections. SCE's IEPR cap methodology is also described in Joint IOU Advice Letter 5747-E, which is currently pending CPUC Resolution. Figure 3 illustrates how SCE applies this framework.

FIGURE 3: IEPR CAP LOGIC – ILLUSTRATIVE ALLOCATION CASES



The IEPR forecast serves as an energy-based benchmark against which forecasted load is evaluated on a year-over-year basis. Within this framework, forecasted demand is separated into non-capped and capped components based on the certainty of the underlying inputs. Higher-confidence loads, such as known LGPs and select high-certainty pending loads, are treated as non-capped and are allowed to exceed the IEPR forecast. Lower-certainty pending loads are subject to IEPR caps and are incorporated in a controlled manner.

For each forecast year, non-capped load is first compared to the IEPR forecast to determine whether available IEPR capacity remains. Available IEPR is defined as the difference between the IEPR forecast and the non-capped load, and represents the remaining capacity available for capped load allocation. Where sufficient IEPR capacity exists, capped load is allocated up to the available limit using a system-wide scaling approach. When capped load exceeds the available IEPR, the unallocated portion is deferred and rolled forward to subsequent years. Any remaining IEPR capacity after capped load allocation is then incorporated through standard econometric disaggregation or DER disaggregation.

This logic results in three general cases. When non-capped load alone exceeds the IEPR forecast, no capped load is allocated, and all capped load is deferred. When total load exceeds the IEPR, but non-capped load remains below it, capped load is partially allocated up to the available IEPR and the remainder is deferred. When total load remains below the IEPR forecast, all capped load is included and the remaining IEPR is disaggregated. These cases provide a

consistent mechanism for aligning forecasts with the IEPR while maintaining visibility into future demand that may materialize over time.

Figure 4 summarizes the Scenario Planning Framework established in Resolution E-5414 and illustrates how load certainty and planning considerations are reflected across forecast scenarios. SCE's application of load growth capping is consistent with Figure 4 from Resolution E-5414.

FIGURE 4: SCENARIO PLANNING FRAMEWORK (E-5414)

Pending Load Category	Description	Low Scenario	Base Scenario	High Scenario
A	High Confidence, Customer Based Projects	Included Can Exceed IEPR	Included Can Exceed IEPR	Included Can Exceed IEPR
BI	Medium Confidence, Customer Based Projects	Excluded	Included Can Exceed IEPR	Included Can Exceed IEPR
B2	Bottom-Up Study	Excluded	Included Capped at IEPR except for hot spots	Included Can Exceed IEPR
C	Low Confidence, Customer Based Projects and Studies	Excluded	Included Capped at IEPR always	Included Capped at IEPR except for hot spots

SCE applies this IEPR cap logic differently across the Low, Base, and High scenarios to reflect varying planning assumptions and risk tolerance. The Low scenario represents a conservative view of demand growth and includes only the highest-confidence loads, known loads and category A pending loads. The Base scenario represents SCE's most likely outlook and incorporates a broader set of pending loads, while applying IEPR caps to lower-confidence categories to manage uncertainty. Within this scenario, medium- and lower-confidence loads are prioritized based on relative certainty, consistent with the Commission framework. The High scenario reflects accelerated demand growth and electrification, allowing greater inclusion of pending loads and permitting more exceedance of the IEPR forecast to support proactive planning for potential high-growth conditions. Consistent with Resolution E-5414, hot spot considerations may also influence the treatment of certain loads in the Base and High Scenarios to support area-specific planning needs.

Through this combined framework, IEPR cap logic and scenario planning work together to help ensure that SCE's forecasts remain aligned with state-adopted projections while providing flexibility to evaluate a range of potential load growth outcomes and inform appropriate infrastructure planning decisions.

4.4. DER Disaggregation

This section describes the data sources and methodology used to disaggregate the CEC's 2024 IEPR system-level DER forecasts for the Local Reliability scenario (Table 1) to individual distribution circuits.[14] Details are provided for the following five DER types:

1) Energy Efficiency (EE)
2) Transportation Electrification (TE): (Light-Duty EV(LDV), Medium & Heavy-Duty Vehicles (MDHD) & Bus)
3) Solar Photovoltaic (PV)
4) Energy Storage (ES) - (Residential (R), Non Residential (NR))
5) Fuel Substitution (FS)

For the 2025–2026 DPP, SCE transitioned its DER disaggregation from a collection of technology-specific propensity models to a single, standardized disaggregation tool. The tool is a version-controlled analytical pipeline that applies a common sequence of steps to every DER type: (1) extraction of the system-level annual forecast from the CEC's hourly (8,760) forecast file; (2) adjustment of forecast quantities from the California Independent System Operator (CAISO) TAC footprint to SCE's distribution service area at the customer-meter level; (3) conversion of the adjusted forecasts to year-over-year increments; (4) technology-specific refinements where warranted; (5) allocation of the incremental values to circuits using customer-count-based allocation factors; and (6) application of normalized hourly load shapes. This standardization improves consistency and reproducibility across DER types, guarantees through automated conservation checks that circuit-level values sum to the system-level forecast, and simplifies stakeholder review of the methodology. SCE presented this methodology at the DFWG.

SCE applies the CEC IEPR 8760 load shapes for EE, ES, MDHD and FS to distribute the annual forecasts for each DER to the hourly level. For the remaining TE, SCE utilizes customized, internally developed charging load shapes (Light-duty home charging, light-duty commercial charging and bus) rather than those provided by the IEPR. SCE uses its own load shapes for DER forecasts when it has more locationally specific or recent data especially for electric vehicle (EV) charging. If such specific data isn't available, SCE defaults to the California Energy Commission's DER profiles. For light-duty EVs, SCE's Advanced Metering Infrastructure (AMI) data for Residential Separate Meter (TOU-D-PRIME) and proprietary AMI data from its Charge Ready program provide detailed insights into EV charging behavior at homes and workplaces. PV is expressed as incremental installed capacity (MW) and is reflected at the circuit peak on a dependability basis rather than through an hourly energy shape.

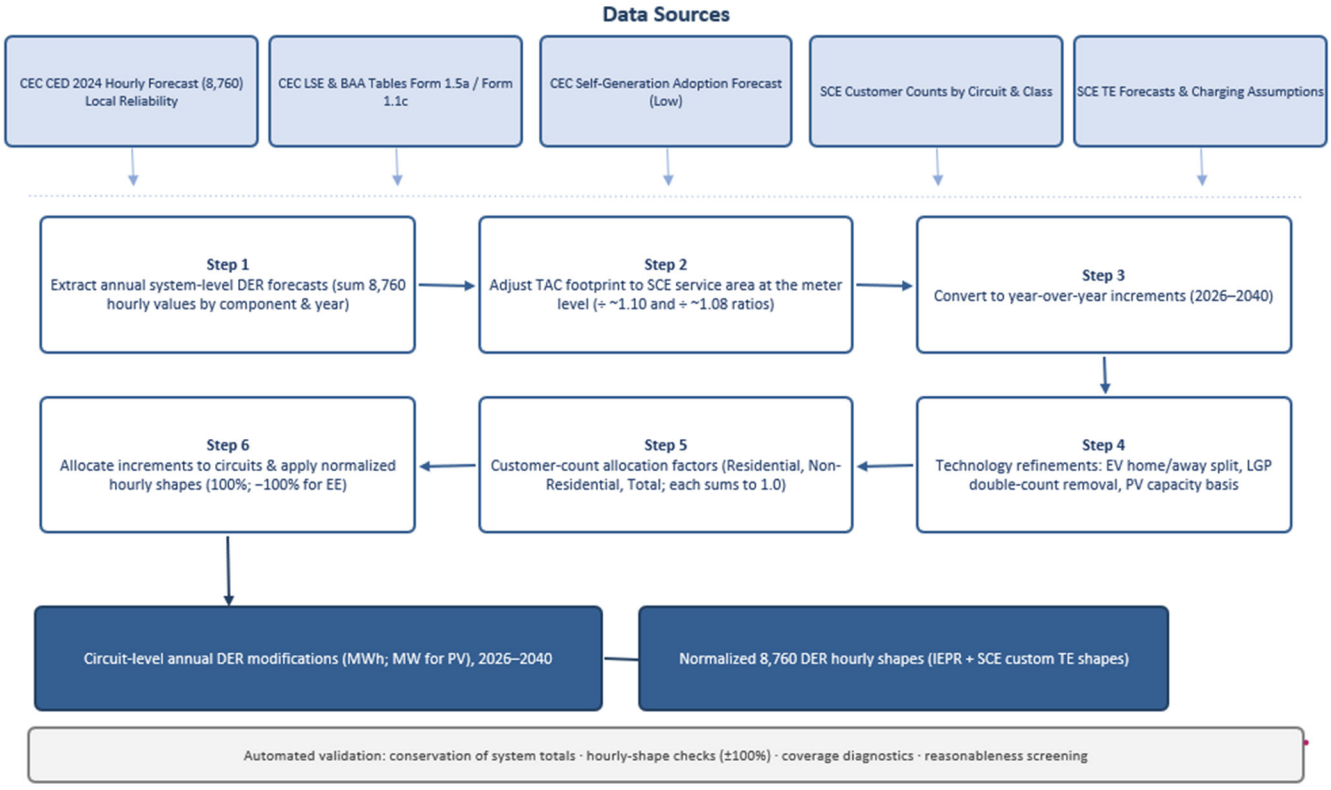
Table 2 summarizes the DER categories produced by the disaggregation tool, the IEPR forecast components from which each is derived, and the allocation basis used to distribute each category to circuits. Figure 5 provides an overview of the disaggregation process. Figure 5 provides an overview of the disaggregation process.

[14] California Energy Commission, CED 2024 Hourly Forecast – SCE – Local Reliability (TN #262282, March 21, 2025, as corrected). The hourly forecast provides 8,760-hour system-level values for each forecast year and demand-modifier component. The IOUs received approval from Energy Division on August 15, 2025, to use the CEC's 2024 IEPR Local Reliability scenario for all IEPR load forecast elements in the 2025-2026 GNA/DUPR cycle.

TABLE 2: DER DISAGGREGATION CATEGORIES, IEPR SOURCES, AND ALLOCATION BASES

DER Category	2024 IEPR Forecast Component(s)	Circuit Allocation Basis	Unit
EE (Energy Efficiency)	AAEE (Scenario 2)	Total customer counts	MWh (savings)
FS (Building Electrification)	AAFS (Scenario 4)	Total customer counts	MWh
EV – Home Charging	Light-Duty EV (Baseline) + AATE LDV (Scenario 3), home-charging share	Residential customer counts	MWh
EV – Commercial (Away) Charging	Light-Duty EV (Baseline) + AATE LDV (Scenario 3), away-charging share	Non-Residential customer counts	MWh
MDHD	Medium & Heavy-Duty EV(Baseline) + AATE MDHD (Scenario 3); circuit values from SCE MDHD forecast	SCE bottoms-up TE forecast	MWh
Bus	Bus EV (Baseline) + AATE Bus (Scenario3); circuit values from SCE Bus forecast	SCE bottoms-up TE forecast	MWh
PV	BTM PV (Low); incremental installed capacity	Total customer counts	MW
ES – Residential	BTM Storage, Residential (Low)	Residential customer counts	MWh
ES – Non-Residential	BTM Storage, Non-Residential (Low)	Non-Residential customer counts	MWh

FIGURE 5: SCE'S OVERALL DER DISAGGREGATION PROCESS



4.4.1. Common Disaggregation Framework

Step 1 – Extract System-Level Annual DER Forecasts: The CEC's hourly demand forecast for the Local Reliability scenario provides 8,760 hourly values per forecast year for each demand-modifier component, including light-duty EV, medium- and heavy-duty EV and bus, additional achievable transportation electrification (AATE light-duty EV, MDHD and bus), behind-the-meter (BTM) PV, BTM storage (residential and non-residential), AAEE, and AAFS. SCE sums the hourly values by forecast year to obtain the annual system-level forecast for each component through 2040. Baseline and additional-achievable components are combined into planning categories: light-duty EV is the sum of the light-duty EV baseline and AATE light-duty components, and MDHD is the sum of the medium- and heavy-duty EV baseline and AATE MDHD components, and bus is the sum of the bus baseline and AATE bus components.

Step 2 – Adjust Forecasts to the SCE Distribution Service Area at the Meter Level: The CEC states its forecast for the SCE planning area on the SCE TAC-area footprint, which includes loads served by other load-serving entities within SCE's transmission system as well as transmission-connected pumping loads, and which reflects energy at the system (busbar) level, inclusive of losses. Because distribution planning requires forecasts specific to SCE's

distribution customers at the customer meter, SCE applies two annual adjustment ratios derived from the CEC's LSE and BAA tables:[15]

- Service-area alignment ratio: the ratio of the total SCE TAC-area load, net of California Department of Water Resources (CDWR) pumping loads, to the load of SCE's retail service area, both taken from Form 1.5a (approximately 1.10 across the forecast horizon). Dividing each DER component by this ratio rescales the TAC-footprint forecast to SCE's distribution service area.
- Loss adjustment ratio: the ratio of SCE's forecasted annual managed net load excluding pumping (derived from the hourly forecast file, which is stated at the system level and therefore includes losses) to the SCE TAC-area annual energy excluding CDWR and Metropolitan Water District pumping loads from Form 1.1c, which is stated on a sales basis (approximately 1.08 across the horizon). Dividing by this ratio removes the embedded losses and restates the forecast at the customer-meter level.

The combined effect of the two adjustments rescales each system-level DER forecast component by approximately 0.84 before disaggregation. The same ratios are applied consistently to every DER category, ensuring that DER and load forecast components are stated on a common footprint.

Step 3 – Convert to Year-over-Year Increments: Because the baseline demand established from historical profiles (Section 3.1) already embeds the effects of DERs installed to date, only incremental DER growth is layered onto the baseline. For each DER category, the tool computes the year-over-year difference of the adjusted annual values and retains increments from the first planning year (2026) through the end of the forecast horizon. Annual increments are expressed as positive magnitudes; the demand-reducing character of EE and PV is captured when profiles are applied, as described in Step 6 and the technology subsections.

Step 4 – Apply Technology-Specific Refinements: Three refinements are applied before allocation. First, the light-duty EV increment is split into home charging (residential) and away (commercial) charging using CEC's annual light-duty residential and commercial -charging share assumptions.[16] Second, consistent with Section 3.2.2, the portions of the TE forecast that are already captured through the LGP process are removed to avoid double counting: near-term away-charging increments are excluded, and the MDHD and bus categories are incorporated from SCE's bottoms-up, circuit-level TE forecast (to build the propensity score to disaggregate IEPR forecast) rather than through customer-count allocation. Third, the PV category is restated from an energy basis to incremental installed nameplate capacity (MW) using the CEC's self-generation adoption forecast.[17]

Step 5 – Develop Customer-Count Allocation Factors: SCE develops circuit allocation factors from customer counts by circuit and customer class obtained from SCE's customer-to-circuit connectivity model.[18] Counts are aggregated

[15] California Energy Commission, CED 2024 Reliability Scenario LSE and BAA Tables (TN #262788, April 24, 2025), Form 1.5a (Balancing Authority Area loads by agency) and Form 1.1c (annual energy by planning area and agency).

[16] California Energy Commission, CED 2024 Baseline Forecast Tables (TN #260928, January 2025), Form 1.1 (Electricity Consumption by Sector (GWh)); the home charging share declines gradually over the forecast horizon as workplace and public charging availability expands.

[17] California Energy Commission, 2025 self-generation adoption planning library, low adoption scenario (TN #262776, April 23, 2025). The low scenario is consistent with the BTM PV and Storage scenario selection shown in Table 1.

[18] Customer counts are derived from SCE's customer-to-transformer-to-circuit connectivity model maintained in SCE's enterprise data platform. Customers are classified as Residential or Non-Residential based on service account attributes.

for each of the approximately 4,200 distribution circuits in scope for the planning year, within three classes: Residential, Non-Residential, and Total (all customers). Each circuit's allocation factor equals its customer count divided by the corresponding system-wide count, so the factors for each class sum to exactly 1.0 across circuits. Each DER category is then assigned the allocation basis that best reflects its adopting population. As shown in Table 2, residential-adopted technologies (home charging, residential storage) use Residential factors; non-residential technologies (commercial charging, non-residential storage) use Non-Residential factors; and technologies adopted across both classes (EE, FS, PV) use Total factors. Circuits in the planning circuit list with no matching customer records are retained with a zero allocation factor and logged for engineering review, preserving exhaustive circuit coverage. The tool also supports structure-level allocation and demand-weighted (kVA-based) factors, providing a path to finer spatial granularity as SCE completes its transition to profile-based forecasting.

Step 6 – Allocate Increments and Apply Hourly Shapes: Each circuit-year value equals the system-level annual increment multiplied by the circuit's allocation factor, so the sum of the circuit-level values reproduces the system-level forecast by construction; an automated conservation check verifies this equality for every DER category and year. To distribute annual values to hours, the hourly values in the CEC forecast are normalized within each component and year so that the hourly percentages sum to 100 percent per year (−100 percent for EE, reflecting its demand-reducing effect), with leap-day handling to preserve annual totals.[19] SCE's customized charging shapes replace the IEPR shapes for the TE categories except the medium & heavy-duty shape. The resulting circuit-level annual DER modifications (MWh; MW for PV) and hourly shapes are integrated with the baseline and load growth forecasts in the net demand forecasting process described in Section 4.2.

4.4.2. Energy Efficiency

This section describes how SCE disaggregates the CEC's IEPR system-level Additional Achievable Energy Efficiency (AAEE) forecast to individual circuits. The AAEE forecast (Scenario 2) contains savings from both voluntary EE programs and mandatory Title 24 codes and standards; SCE disaggregates the combined AAEE forecast as provided in the CEC hourly forecast file.

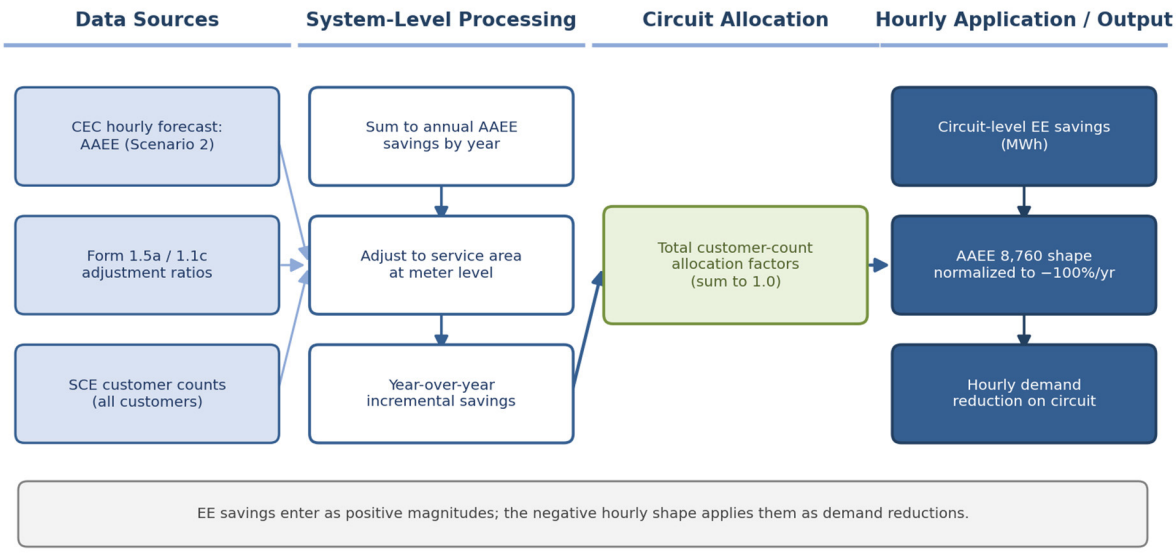
1. Step 1 – Extract and adjust the AAEE forecast: Annual AAEE savings are computed from the CEC hourly forecast and adjusted to the SCE service area at the meter level using the two ratios described in the common framework (Step 2).
2. Step 2 – Compute annual incremental savings: The adjusted AAEE savings are differenced year-over-year to isolate the incremental savings added in each forecast year.
3. Step 3 – Allocate to circuits: Incremental savings are allocated to circuits using Total customer-count allocation factors, reflecting that EE measures are adopted across residential and non-residential customers alike.

[19] Pacific Standard Time. Hourly shape values are stated in percent such that the sum across all hours of a forecast year equals 100 percent (or −100 percent for energy efficiency).

4. Step 4 – Apply the hourly shape: The CEC-supplied AAEE 8,760 profile is normalized such that the hourly percentages sum to −100 percent for each forecast year; applying this shape to the circuit-level annual savings produces hourly demand reductions.

Illustrative Example: Assume the meter-level AAEE savings forecast is 2,970,000 MWh in 2026 and 3,270,000 MWh in 2027, yielding an incremental savings of 300,000 MWh in 2027. Circuit X serves 6,000 customers out of 15,000,000 total customers in SCE's service territory, for a Total allocation factor of 0.04% (6,000 / 15,000,000 × 100 = 0.04%). Circuit X is therefore assigned 120 MWh of incremental EE savings in 2027 (300,000 MWh × 0.04% = 120 MWh), which the negative hourly shape applies as a reduction to the circuit's hourly demand forecast.

FIGURE 6: ENERGY EFFICIENCY FLOWCHART



4.4.3. Transportation Electrification

For this planning process, SCE disaggregated the forecast for light-duty electric vehicles and non-light-duty vehicles, which include medium- and heavy-duty (MDHD) trucks and buses. Consistent with Section 3.2.2, SCE first removes the portion of the TE forecast associated with LGPs and disaggregates the remainder, ensuring that TE demand identified through customer engagement is not double counted.

4.4.3.1. ELECTRIC VEHICLES (LIGHT DUTY)

The light-duty EV forecast is the sum of the IEPR baseline light-duty EV component and the AATE light-duty component (Scenario 3). After adjustment to the meter level and conversion to year-over-year increments, SCE splits each year's increment into home charging and away (commercial) charging using CEC's annual home-charging

share assumptions (approximately 60 percent home charging in the near term, declining gradually over the forecast horizon).[20]

1. Step 1 – Compute the adjusted incremental light-duty EV forecast, as described in the common framework.

2. Step 2 – Split each annual increment into home and away charging using the CEC's annual home-charging share.

3. Step 3 – Remove the LGP-covered portion: away-charging increments in the near-term years are set to zero because commercial charging installations in those years are identified and allocated through the known and pending LGP process; away-charging increments in later years, beyond the LGP pipeline's visibility, are incorporated from SCE's TE forecast.

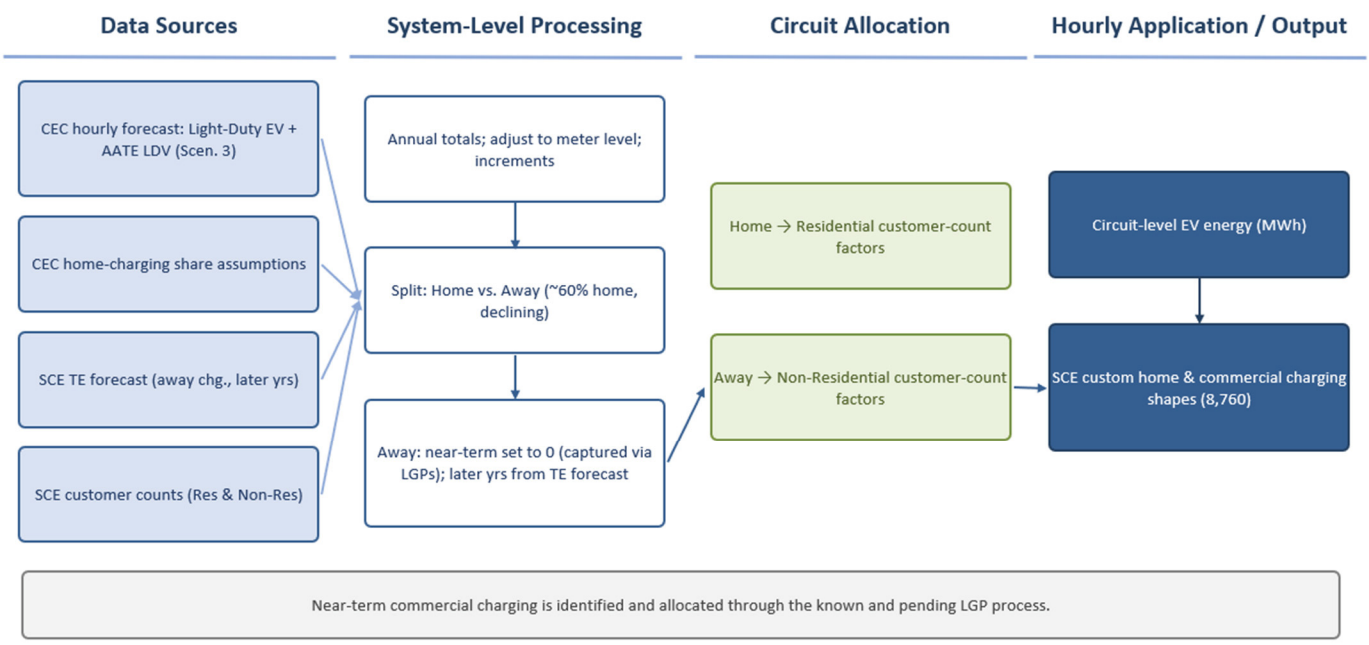
4. Step 4 – Allocate home charging to circuits using Residential customer-count factors and away charging using Non-Residential customer-count factors.

5. Step 5 – Apply SCE's customized home-charging and commercial-charging hourly load shapes, which reflect observed charging behavior, charging start times, and duration.

Illustrative Example: Assume the meter-level light-duty EV increment in 2027 is 600,000 MWh and the home-charging share is 59 percent, yielding 354,000 MWh of home charging and 246,000 MWh of away charging. Circuit X serves 6,250 residential customers out of 15,000,000 residential customers system-wide, for a Residential allocation factor of 0.04% (6,250 / 15,000,000 × 100 = 0.04%); Circuit X is therefore assigned 148 MWh of home-charging load in 2027 (354,000 MWh × 0.04% = 148 MWh). No away-charging increment is allocated for 2027 because near-term commercial charging is captured through the LGP process. In 2031, where the away-charging increment from SCE's TE forecast is 690,000 MWh and Circuit Y's Non-Residential allocation factor is 0.03%, Circuit Y is assigned 207 MWh (690,000 MWh × 0.03% = 207 MWh).

[20] California Energy Commission, CED 2024 Baseline Forecast Tables (TN #260928, January 2025), Form 1.1 (Electricity Consumption by Sector (GWh)); the home charging share declines gradually over the forecast horizon as workplace and public charging availability expands.

FIGURE 7: ELECTRIC VEHICLE FLOWCHART



4.4.3.2. MEDIUM AND HEAVY-DUTY AND BUS (NON-LIGHT DUTY)

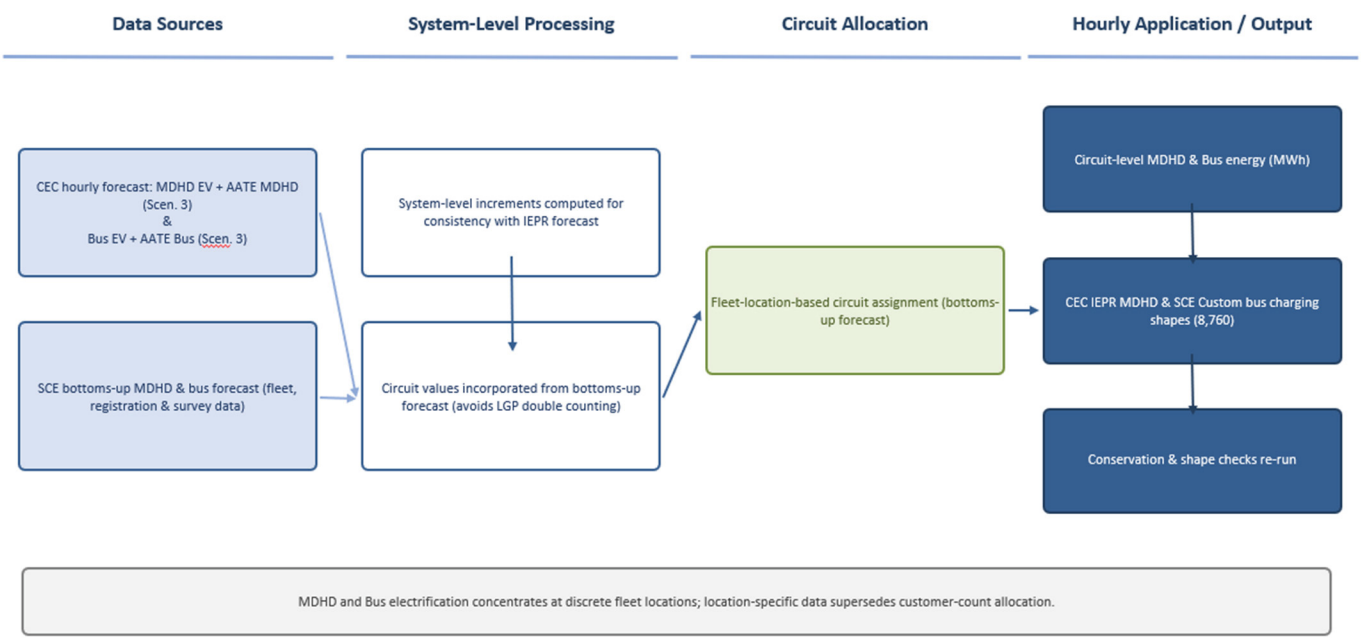
The MDHD category is derived from the IEPR medium- and heavy-duty EV baseline combined with the AATE MDHD component (Scenario 3), while the bus category is derived from the IEPR bus baseline combined with the AATE bus component (Scenario 3). Both categories are subject to the same adjustment and incremental calculation methodology applied to other DERs to ensure consistency with the system-level forecast. However, because MDHD and bus electrification is concentrated at discrete fleet locations rather than distributed in proportion to customer counts, the circuit-level MDHD and bus propensity scores are derived from SCE's bottoms-up MDHD and bus forecast, which assesses anticipated fleet electrification at specific locations using vehicle registration and operations data and fleet survey responses.[21] This treatment also prevents double counting between the disaggregated IEPR forecast and MDHD and bus charging projects identified through the LGP process. SCE applies CEC IEPR MDHD and customized bus hourly charging shapes; after these values are incorporated, the conservation and shape checks described in Section 4.4.6 are re-run on the combined outputs.

Illustrative Example: Assume that, based on SCE's bottom-up incremental medium- and heavy-duty (MDHD) forecast, Circuit C has a forecast value of 400 MWh in 2030, while the total incremental MDHD forecast across SCE's service territory is 500,000 MWh in 2030. The propensity score for Circuit C is calculated by dividing the circuit-level MDHD forecast by the total MDHD forecast in SCE's service territory (400 / 500,000 = 0.0008). Therefore, Circuit C accounts for 0.08% of the total MDHD forecast (0.0008 × 100 = 0.08%). If the CEC incremental MDHD load forecast

[21] SCE's circuit-level MDHD and bus electrification forecasts are developed from a bottoms-up assessment of fleet operators, vehicle registration and operations data, and fleet survey responses within SCE's service area, consistent with the vehicle analytics approach funded through SCE's LCFS TE Research and Studies portfolio authorized by Resolution E-5236.

for SCE's service territory is 480,000 MWh in 2030, the incremental MDHD load forecast for Circuit C is calculated as 384 MWh (0.0008 × 480,000 MWh = 384 MWh).

FIGURE 8: MEDIUM & HEAVY-DUTY AND BUS FLOWCHART



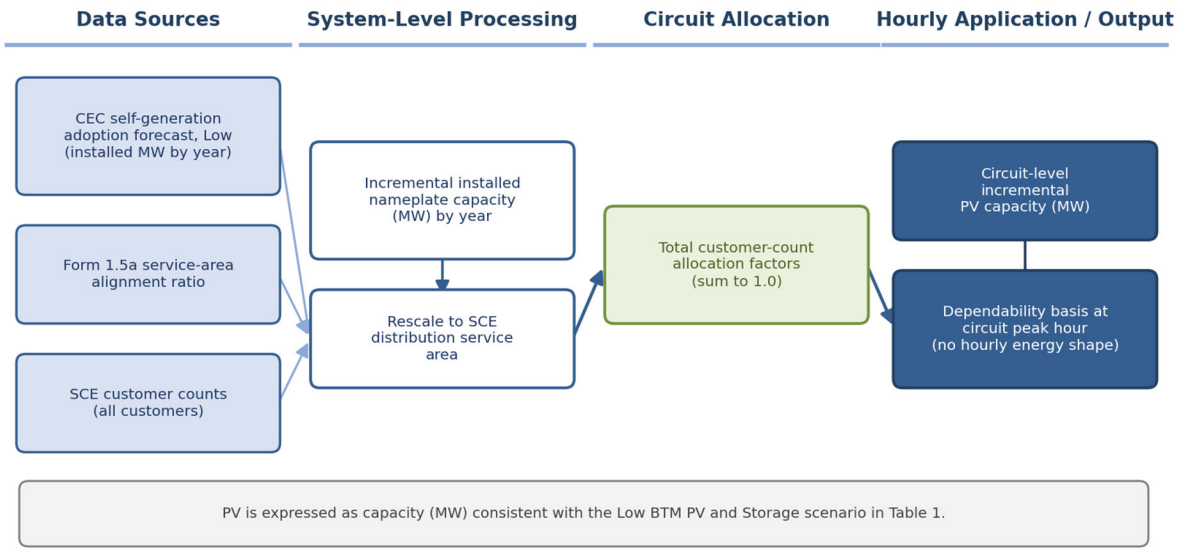
4.4.4. Solar Photovoltaics (Residential and Non-Residential)

The BTM PV forecast is taken from the Low BTM PV and Storage scenario, consistent with Table 1. Because PV's principal effect on distribution planning is its capacity contribution at the time of circuit peak, SCE expresses the PV category as incremental installed nameplate capacity (MW) rather than annual energy. Incremental installed capacity by year is obtained from the CEC's self-generation adoption forecast for the SCE planning area (low adoption scenario),[22] rescaled to SCE's distribution service area using the service-area alignment ratio described in the common framework. Incremental capacity is allocated to circuits using Total customer-count factors, reflecting adoption across residential and non-residential customers. The capacity values are netted against circuit demand on a dependability basis at the circuit peak hour — that is, according to the PV output that can be relied upon at the time of the circuit's peak demand — rather than through an hourly energy shape.

Illustrative Example: Assume the service-area incremental installed PV capacity in 2027 is 260 MW. Circuit X's Total allocation factor is 0.04%, so Circuit X is assigned 0.104 MW of incremental PV capacity in 2027 (260 MW × 0.04% = 0.104 MW). At the circuit's peak hour, the dependable portion of this capacity reduces the circuit's forecasted net peak demand.

[22] California Energy Commission, 2025 self-generation adoption planning library, low adoption scenario (TN #262776, April 23, 2025). The low scenario is consistent with the BTM PV and Storage scenario selection shown in Table 1.

FIGURE 9: SOLAR PHOTOVOLTAICS FLOWCHART

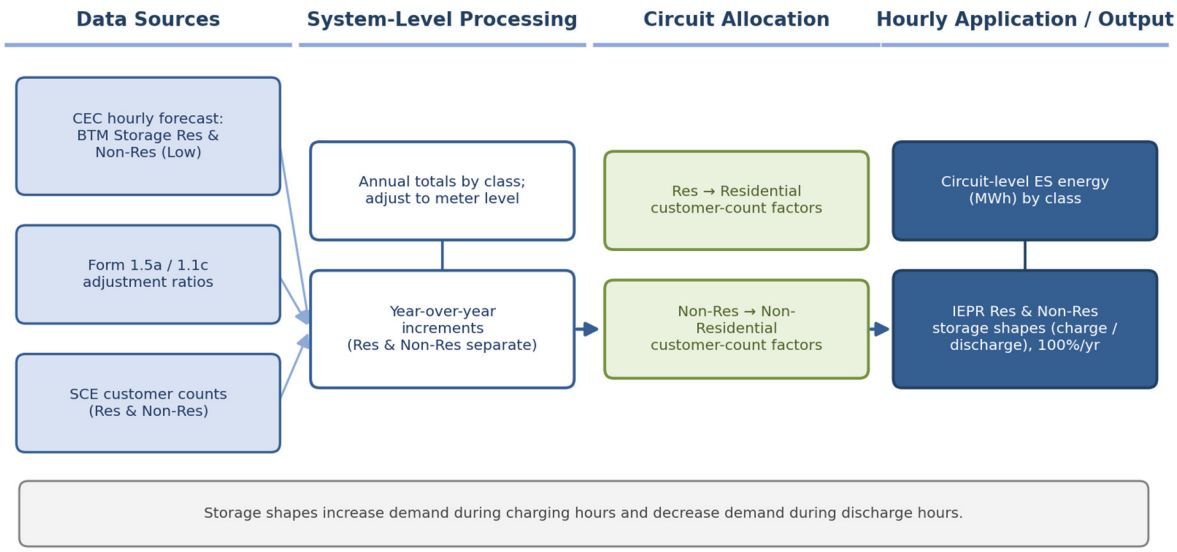


4.4.5. Energy Storage

The BTM energy storage forecast is taken from the Low BTM PV and Storage scenario and is provided by the CEC as separate residential and non-residential components, which SCE maintains as distinct DER categories throughout the disaggregation. After adjustment to the meter level and conversion to year-over-year increments, residential storage is allocated to circuits using Residential customer-count factors, and non-residential storage is allocated using Non-Residential customer-count factors. SCE applies the CEC's separate residential and non-residential 8,760 storage profiles, normalized to sum to 100 percent per year, which reflect the daily charge and discharge patterns of BTM storage (demand increases during charging hours and decreases during discharge hours).

Illustrative Example: Assume the meter-level residential storage increment in 2027 is 6,000 MWh. Circuit X's Residential allocation factor is 0.05%, so Circuit X is assigned 3 MWh of incremental residential storage energy in 2027 (6,000 MWh × 0.05% = 3 MWh), distributed to hours by the residential storage profile such that charging and discharging effects are reflected in the circuit's hourly net demand.

FIGURE 10: ENERGY STORAGE FLOWCHART

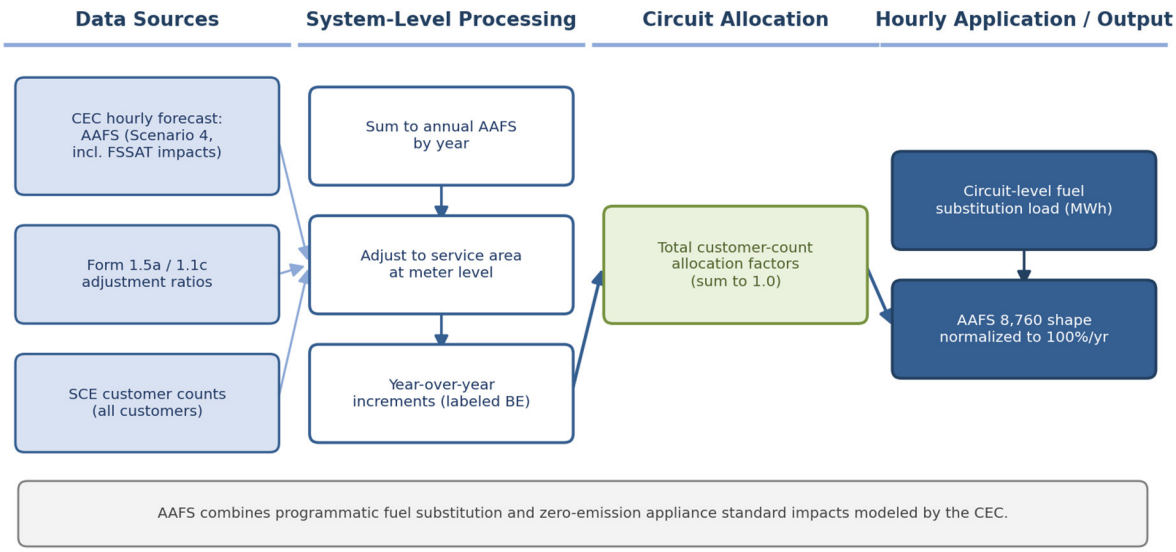


4.4.6. Fuel Substitution (Residential and Non-Residential)

Fuel substitution involves the transition from appliances that use one fuel to another, typically decreasing gas use and increasing electricity use. SCE disaggregates the CEC's Additional Achievable Fuel Substitution (AAFS) forecast (Scenario 4), which is inclusive of programmatic fuel substitution and the incremental electricity consumption associated with zero-emission appliance standards modeled by the CEC (e.g., California Air Resources Board State Implementation Plan and local air district rules). In SCE's planning outputs this category is labeled Building Electrification (BE). The combined AAFS forecast is adjusted to the meter level, converted to year-over-year increments, and allocated to circuits using Total customer-count factors, reflecting adoption across residential and non-residential buildings. The CEC-supplied AAFS 8,760 profile, normalized to 100 percent per year, distributes the annual values to hours.

Illustrative Example: Assume the meter-level AAFS increment in 2027 is 750,000 MWh. Circuit X's Total allocation factor is 0.04%, so Circuit X is assigned 300 MWh of incremental fuel substitution load in 2027 (750,000 MWh × 0.04% = 300 MWh), distributed to hours by the normalized AAFS profile.

FIGURE 11: FUEL SUBSTITUTION FLOWCHART



4.4.7. Validation and Quality Controls

The disaggregation tool embeds automated validation at each stage of the pipeline, and the checks are re-run whenever inputs or assumptions change:

- Conservation of system totals: for every DER category and forecast year, the sum of circuit-level values is compared to the system-level increment; deviations beyond a tolerance of one part per million are flagged and investigated.
- Hourly shape verification: every DER hourly shape must sum to exactly 100 percent (−100 percent for EE) within each forecast year, including for leap years and for any customized TE shapes that replace IEPR shapes; the pipeline halts if the check fails.
- Reasonableness screening: negative year-over-year increments, which can occur when the underlying IEPR forecast flattens or declines, are automatically flagged for analyst review.
- Coverage diagnostics: circuits in the planning circuit list without matching customer records are written to a diagnostic report and reviewed, ensuring every in-scope circuit is accounted for in the allocation.
- Consistency checks on refinements: adjustments such as the EV home/away split are verified to preserve category totals, and any adjustment that changes a total is surfaced as a warning for review.

The tool is maintained under version control with an automated test suite, providing a reproducible and auditable record of the methodology applied in each planning cycle. Methodology changes are presented to the DFWG for stakeholder review prior to use in the annual DPP.

4.4.8. Summary of Methodological Changes from Prior Cycles

Table 3 summarizes the principal differences between the DER disaggregation methodology used in prior planning cycles and the standardized methodology adopted for the 2025–2026 DPP.

TABLE 3: DER DISAGGREGATION METHODOLOGY CHANGES FOR THE 2025–2026 DPP

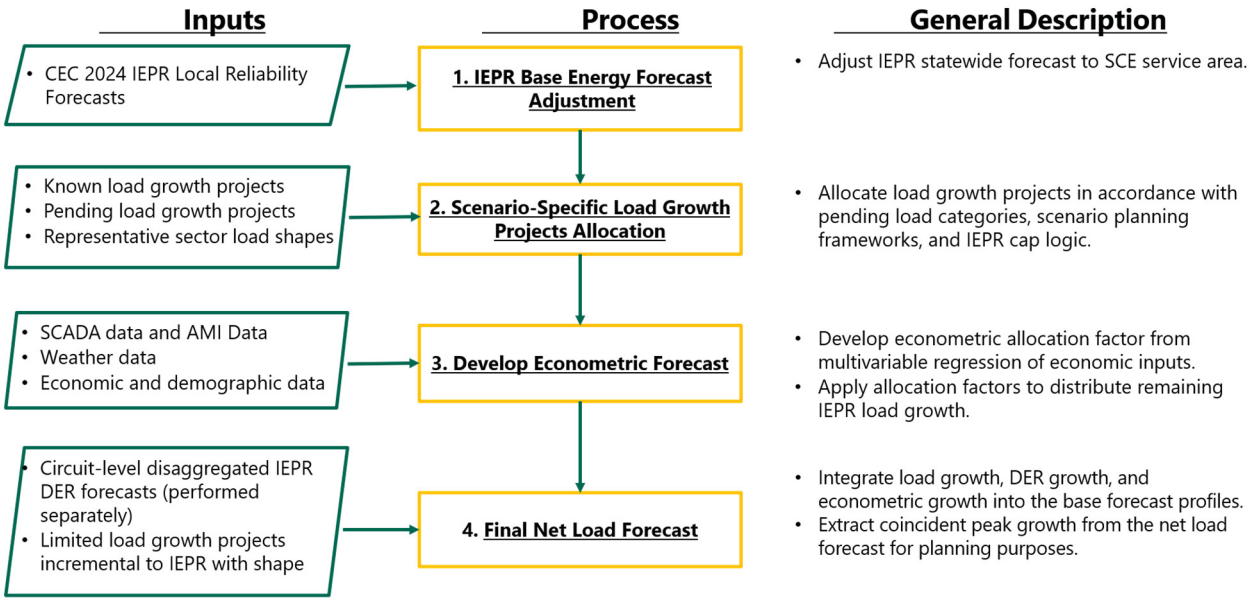
DER Category	Prior Methodology	2025–2026 DPP Methodology
EE	Proportional scaling by circuit sectoral energy-use shares	Total customer-count allocation factors applied to meter-level incremental AAEE savings
EV (Light Duty)	ZIP-Code propensity model based on household income, ACS demographics, and ZIP-to-circuit mapping	Home/away split using home-charging share; Residential and Non-Residential customer-count allocation; near-term away charging captured via LGP process
MDHD / Bus	Circuit propensity scores derived from the Guidehouse VAST study applied to the IEPR forecast	Circuit propensity scores derived from the SCE's bottoms-up circuit-level MDHD and Bus forecast applied to the IEPR forecast
PV	Bass diffusion adoption modeling, housing-start and Title 24 new-construction allocation	Incremental installed capacity (MW) from the CEC self-generation adoption forecast, allocated by Total customer counts; dependability treatment at peak
ES	Weighted PV/EV circuit shares, SGIP equity-resiliency allocation, and peak-to-energy-ratio screening	Residential and Non-Residential customer-count allocation of the respective BTM storage components
FS	Four-bucket allocation using sectoral energy use and housing/building stock forecasts	Total customer-count allocation of the combined AAFS forecast (labeled Building Electrification)
All categories	Component-specific footprint treatment; manual conservation review	Uniform TAC-to-service-area and loss adjustments; automated conservation, shape, and coverage checks; version-controlled tool

These changes standardize the allocation basis across DER categories, make the footprint and loss adjustments explicit and uniform, and strengthen quality controls, while preserving technology-specific treatment where location-specific information provides superior accuracy (MDHD and bus) and where planning practice requires a capacity basis (PV).

4.5. Load Growth Allocation and IEPR Consumption Disaggregation

The load growth allocation and consumption disaggregation process translates the system-level IEPR consumption forecast into structure-level load growth forecasts while incorporating project-specific information obtained through SCE's customer engagement and planning activities. Consistent with the CPUC scenario planning framework, known loads and pending loads are incorporated first, with the remaining IEPR consumption forecast subsequently allocated through econometric methods. The following sections describe the principal data sources, assumptions, and analytical methods used in this process.

FIGURE 12: LOAD GROWTH ALLOCATION AND IEPR CONSUMPTION DISAGGREGATION PROCESS



Step 1. Calculate IEPR Energy Specific to SCE Distribution System

As discussed in Section 4.1, SCE derives an annual energy consumption forecast specific to its distribution planning needs from the CEC Energy Demand Forecast. Adjustments are made to remove forecast components that are separately modeled within the DPP or are not served by SCE's distribution system. The resulting annual incremental energy forecast serves as the starting point for load growth allocation and IEPR consumption disaggregation.

Step 2. Allocate Known and Pending Load Growth Projects

SCE incorporates known LGPs and pending loads using information collected through customer engagement, local planning activities, and coordination with district personnel. For each project, information regarding location, anticipated demand, development status, and expected energization timing is collected.

Project loads are converted to annual energy using representative customer-sector load shapes and diversity assumptions. These loads are then classified and evaluated under the applicable pending load, IEPR cap logic, and hot spot frameworks before being incorporated into the applicable Low, Base, or High planning scenario as described in Section 4.3.

Known loads and eligible pending loads are allocated to the applicable distribution structures before disaggregation of the remaining IEPR consumption forecast. As described in Section 4.3, load allocation is performed consistent with the IEPR cap logic, which determines the amount of annual load growth that can be incorporated in each forecast year and planning scenario. This approach prioritizes project-specific information while maintaining alignment with the annual IEPR energy forecast.

Step 3. Disaggregate Remaining IEPR Consumption Growth

After eligible known and pending load growth has been allocated, the remaining IEPR consumption forecast is disaggregated using SCE's internally developed econometric forecasting methodology.

The econometric forecasting process utilizes multivariable time-series regression models to develop monthly energy forecasts for individual distribution structures. Model inputs include historical demand profiles, demographic and economic indicators, land-use characteristics, and weather information. Multiple regression specifications are evaluated to identify the best-performing model for each structure based on statistical fit and forecast accuracy metrics.

The resulting econometric forecasts represent the portion of future load growth not directly associated with identified projects and are used to allocate the remaining annual IEPR consumption forecast to distribution structures.

Step 4. Apply Additional Incremental Load Growth Projects and Develop Hourly Load Growth Forecasts

Certain load growth categories are not fully represented in the IEPR consumption forecast and are therefore incorporated separately. These include specific categories of Temporary Power projects, WDAT projects, and Firm Battery Energy Storage System charging projects that are identified during load growth project collection. These loads are allocated directly to the applicable distribution structures based on project-specific information and anticipated energization timing.

Following the allocation of known LGPs, pending loads, incremental LGPs and econometric growth, annual load growth forecasts are converted into hourly load profiles for use in distribution planning studies. Project-specific load growth is converted using representative customer-sector load shapes, while econometric growth is distributed using circuit-specific historical demand profiles. This process preserves both the magnitude and temporal characteristics of the forecasted demand growth and produces structure-level hourly load growth forecasts that are subsequently integrated with baseline demand and DER forecasts to develop the net demand forecast.

4.5.1. An Illustrative Example

This example illustrate how load growth is allocated and disaggregated under the IEPR cap logic and scenario planning framework.

At the system level, assume the Year 1 IEPR consumption forecast is 1,000 GWh. Under the Base Scenario, SCE allocates 700 GWh of known loads and Category A pending loads, which are treated as non-capped load. Additional 500 GWh of Category C pending load is identified. Because the non-capped load consumes 700 GWh of the available IEPR forecast, only 300 GWh remains available for capped load allocation. Accordingly, 300 GWh of the Category C

pending load is allocated in Year 1, while the remaining 200 GWh is deferred to subsequent years in accordance with the IEPR cap logic.

In Year 6, assume the IEPR consumption forecast is 800 GWh, of which 600 GWh has already been allocated to known and pending loads. The remaining 200 GWh is available for econometric disaggregation. If the aggregate econometric growth across all circuits totals 400 GWh, a scaling factor of 0.5 is applied so that the total econometric allocation remains aligned with the remaining IEPR consumption forecast.

At the circuit level, assume Circuit A serves a new commercial development classified as a known load project. The project is forecasted to add 1.5 MW of demand beginning in Year 1. Applying a diversity factor of 0.75 results in a diversified demand of 1.125 MW. The load is converted into an hourly profile using a representative commercial load shape and allocated directly to Circuit A. If Circuit A's annual peak occurs at 6:00 PM on August 29 and the commercial load shape contributes 82% of its peak demand during that hour, approximately 0.92 MW (1.125 MW × 82%) is reflected in the circuit peak forecast.

Assume Circuit A is forecasted to experience 1,000 MWh of econometric growth in Year 6. Applying the 0.5 scaling factor results in 500 MWh being allocated to the circuit. This growth is distributed across the year using Circuit A's normalized hourly load profile. If the allocation factor at the circuit peak hour is 0.0004, then approximately 0.2 MW of incremental demand is reflected in the circuit peak forecast.

Assume Circuit A also serves a 2 MW Firm Charging BESS project that is not represented in the IEPR forecast. Because the project represents dedicated charging capacity reserved for the customer, the full 2 MW is incorporated into the circuit forecast as incremental load growth.

Finally, the allocated known and pending load growth, econometric growth, and incremental load growth projects are combined with baseline demand and disaggregated DER forecasts. The resulting integrated 8760-hour forecast is then used to determine the circuit peak demand and coincident load impacts for distribution planning purposes.

4.5.2. Forecast Assumptions and Methodological Enhancements

SCE's annual DPP produces a 13-year forecast using the best available information at the time of development. Forecast assumptions may be updated annually to reflect changes in regulatory requirements, planning methodologies, system configuration, customer project information, economic and demographic forecasts, weather data, and historical demand patterns. As a result, each annual forecast supersedes the previous planning cycle and remain effective until a subsequent forecast is developed.

Key inputs used in developing the forecast include:

1. CEC IEPR load and DER forecasts;
2. Economic and demographic data used in the econometric forecasting models;
3. Historical asset and system characteristics;
4. Customer load growth project information;
5. Weather station and historical temperature data: and
6. Historical demand and net demand profiles.

SCE continues to enhance its forecasting methodologies and planning tools. These enhancements support increased use of profile-based forecasting, improved integration of load growth and DER impacts, and more granular analysis of system conditions to support distribution planning decisions.

5. Known Load Projects Overview

This section describes SCE's implementation of the known load project reporting requirements established through prior DIDF reforms and incorporated into the current Distribution Planning framework under CPUC D.24-10-030. These requirements are intended to improve transparency regarding customer-specific load requests, project type, timing, and materialization outcomes. Consistent with CPUC requirements, SCE's GNA/DUPR filing includes a detailed review of known load projects, including project types, counts, load amounts, timing, and outcomes.

Additional information regarding pending load projects is provided in Section 6 Pending Load Projects Overview. Pending load projects are reported and evaluated separately from known load projects and are excluded from known load project tracking and materialization metrics.

5.1. Understanding the Known Load Projects

Known load projects represent customer-specific load requests that have sufficient information and certainty to be incorporated into SCE's distribution planning process. These projects are tracked throughout their lifecycle to support load forecasting, identify potential distribution system needs, and evaluate infrastructure requirements associated with future customer load growth. Known load project reporting provides transparency into project characteristics, expected and actual load additions, anticipated timing, and project outcomes.

The Known Load Project Report represents a point-in-time snapshot of projects included in SCE's planning process as of the annual data capture date. Project status, load amounts, and energization dates may change over time as customer plans evolve and additional information becomes available.

The Known Load Projects Report accompanying SCE's 2026 GNA/DUPR filing includes project-level information used for distribution planning and load tracking. Table 4 summarizes all fields included in the Known Load Project Report and provides a description of each attribute. These fields include project identifiers, substation and circuit information, load classifications, requested and actual load amounts, service request and energization dates, project status, and associated DUPR identifiers. The report is intended to provide transparency into project characteristics, load impacts, timing, and progression through the planning process.

TABLE 4: KNOWN LOAD REPORT COLUMN REQUIREMENT FULFILLMENT AND DESCRIPTION

Attribute/Field	Brief Description
Unique Modifier	Unique identifier for each known load.
Distribution Substation Name	Name of the distribution substation that would serve the known load.
Distribution Substation ID	ID of the distribution substation that would serve the known load.
Substation Bus	Bus ID that would serve the known load.
Distribution Circuit Name	Name of the circuit serving the known load.

Distribution Circuit ID	ID of the circuit serving the known load.
Load Type	Load type classification. Categories include Agriculture, Commercial, Residential, Industrial, Transportation, or Energy Storage. SCE currently does not have any Known Load Projects classified under the Energy Storage load type.
Load Category	Subcategory of the load type.
Expected Load Amount (MVA)	Expected load amount associated with the known load request. This value does not reflect any adjustments applied through SCE's load forecast process.
Initial Service Request Date	Date or year the customer initially requested the known load to be actively energized
Current Expected Energization Date	Date or year the known load is expected to be energized by the utility.
Status	Status of the known load. Status options include New, Ongoing, Cancelled, Energized, Reactivated, Deprioritized (Removed from Forecast), and Reclassified as Pending Load. The statuses Reactivated, Deprioritized (Removed from Forecast), and Reclassified as Pending Load were introduced to improve project classification and provide greater transparency into project progression and forecast assumptions. Projects classified as Deprioritized (Removed from Forecast) have been removed from forecast assumptions due to lower confidence and are not treated as Pending Loads. Projects classified as Reclassified as Pending Load have been transitioned to the Pending Load report. Projects with either status are excluded from Known Load Project tracking and metrics. Reactivated indicates a project that was previously Cancelled or Completed but has since become active again and is included in project tracking and metrics.
Actual Energization Date	Date associated with customer energization. Depending on the methodology used to populate this date in the project tracker, this date may represent either the target customer energization date or the date when customer load began to materialize (service initiation). SCE is working to standardize how this field is populated.
Actual Load Amount (MVA)	Actual load amount being used by the customer. SCE is working to standardize how this field is populated. For reporting purposes, the requested load amount will be used until field population is standardized.
DUPR ID	Distribution Upgrade Project Report ID for planned project(s) that the known load depends on.

5.2. Known Load Project Metrics

The metrics presented in this section evaluate the progression, timing, materialization, and outcomes of known load projects tracked through SCE's annual reporting process. Consistent with the methodology outlined in the 2026 Final IPE Post-DPAG Report,[23] these metrics provide transparency into known load project trends, outcomes, and load materialization over time.

The metrics compare two back-to-back tracking datasets: the prior dataset, Plan Year 2025 (PY25), and the current dataset, Plan Year 2026 (PY26). Each "Tracking Dataset" is a point-in-time snapshot of known load projects. PY25 covers forecast years 2025–2034, and PY26 covers 2026–2035. Only the overlapping years (2026–2034) can be compared, so 2025 and 2035 are left out of the year-over-year change metrics. "MVA" measures load amount, and "count" is the number of projects.

[23] Resource Innovations, 2026 Independent Professional Engineer, Final IPE Post DPAG Report, 3/15/2026, p. 41. https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M602/K348/602348669.PDF

For the percentage-change metrics, the denominator is drawn from the projects in the 2025 GNA/DUPR Known Load Report that qualify as Known Loads. If an ongoing project shows an annual change in a given year but did not have load present in the 2025 GNA/DUPR Known Load Report for that given year, it is treated as a zero for that year.

1. Total of all Known Loads (MVA and Count)

The following metric shows the total known load for the current dataset (PY26), covering forecast years 2026 through 2035. The first table shows the total load size each year in MVA; the second shows the count of known load projects each year. Only known loads with a status of New or Ongoing are included.

Total MVA of all known loads by year:

Forecast Year	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Sum of Load Amount	2394.8	788.6	289.3	115.1	63	26	30.4	23.6	22.5	129.7

Calculation Methodology:

For each forecast year in PY26, the load amounts (MVA) of every known load are added together to produce the total MVA for that year. Only known loads with a status of New or Ongoing are included.

Number of all known loads by year:

Forecast Year	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Count of Known Loads	1760	450	137	60	34	19	9	6	4	3

Calculation Methodology:

For each forecast year in PY26, the count of known loads is counted to produce the total count for that year. Only known loads with a status of New or Ongoing are included.

2. Total of all Known Loads by Type/Category (MVA and Count)

The following metric shows the same total known loads described in Metric 1, separated by type/category. The first table shows the total load size each year in MVA; the second shows the count of known load projects each year. Only known loads with a status of New or Ongoing are included.

Total MVA of all known loads by year:

Forecast Year	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	Grand Total
Agriculture	39.5	1.2	0.7	0	0	0	0	0	0	0	41.4
Commercial	614.1	213	102.8	16.3	16.4	-6.5	6.4	0.4	0	0	962.9
Education	24.2	6.7	4.6	1.9	1.9	0	0	0	0	0	39.3
Health Care	29.4	7.2	0.5	0	0	0	0	0	0	0	37.1
Business	213.5	72	18.7	3.5	11.7	2.4	4.3	0	0	0	326.1
Other	347	127.1	79	10.9	2.8	-8.9	2.1	0.4	0	0	560.4
Industrial	260.6	109.2	15	11.9	0	1.4	0	0	0	17.6	415.7
Plants	122.9	40.1	8	0	0	0	0	0	0	0	171
Facilities	22.2	4.5	2.2	7.5	0	0	0	0	0	0	36.4
Cultivation	102.2	63.2	4.6	4.1	0	1.4	0	0	0	0	175.5

Other	13.3	1.4	0.2	0.3	0	0	0	0	0	17.6	32.8
Residential	359.2	235	147.9	80.4	43.7	26.6	24	23.2	22.5	112.1	1074.6
Home Construction	321.3	217.2	143.7	76.5	40	26.6	24	23.2	22.5	112.1	1007.1
Other	37.9	17.8	4.2	3.9	3.7	0	0	0	0	0	67.5
Transportation	1121.4	230.2	22.9	6.5	2.9	4.5	0	0	0	0	1388.4
LD EV	744.6	76.1	3.6	0	2.9	0	0	0	0	0	827.2
MD/HD EV	376.8	154.1	19.3	6.5	0	4.5	0	0	0	0	561.2

Count of all known loads by year:

Forecast Year	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	Grand Total
Agriculture	79	3	1	0	0	0	0	0	0	0	83
Commercial	539	134	30	11	12	3	3	1	0	0	733
Education	25	5	2	1	1	0	0	0	0	0	34
Health Care	24	5	1	0	0	0	0	0	0	0	30
Business	218	60	10	3	3	1	1	0	0	0	296
Other	272	64	17	7	8	2	2	1	0	0	373
Industrial	142	38	10	4	0	1	0	0	0	1	196
Plants	67	15	4	0	0	0	0	0	0	0	86
Facilities	10	5	3	1	0	0	0	0	0	0	19
Cultivation	62	17	2	2	0	1	0	0	0	0	84
Other	3	1	1	1	0	0	0	0	0	1	7
Residential	417	192	91	42	21	14	6	5	4	2	794
Home Construction	382	178	87	41	20	14	6	5	4	2	739
Other	35	14	4	1	1	0	0	0	0	0	55
Transportation	583	83	5	3	1	1	0	0	0	0	676
LD EV	436	32	1	0	1	0	0	0	0	0	470
MD/HD EV	147	51	4	3	0	1	0	0	0	0	206

Calculation Methodology:

The same calculations used in Metric 1 are applied, with the results separated by type/category.

3. Annual Change (relative to the previous Tracking Data submitted by the utility) in total of all Known Loads (MVA, Count, and %)

The following metric shows the annual change in total known load for the current dataset (PY26) relative to the previous dataset (PY25). The first table shows the change in total load size each year in MVA and as a percentage; the second shows the change in the count of known load projects each year and as a percentage. Only known loads with a status of New or Ongoing in both the PY25 and PY26 datasets are included. The comparison covers only the forecast years present in both cycles, so 2025 and 2035 are excluded.

Annual change in total of all known loads (MVA and %):

Forecast Year	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Annual Change (MVA)		1638.2	533.9	103.2	50.9	15.1	-4.6	-4.3	-0.3	10	
Annual Change (%)		194.6%	191.3%	53.0%	75.5%	21.5%	-15%	-12.4%	-1.3%	80%	

Calculation Methodology:

Annual Change (MVA) - For each shared forecast year, every project's PY25 load is subtracted from its PY26 load, and these differences are added together across all projects to produce the total annual change in load size (MVA) for that year. Only known loads with a status of New or Ongoing in both the PY25 and PY26 datasets are included. A positive value reflects an increase in load size from PY25 to PY26; a negative value reflects a decrease.

Annual Change (%) - For each shared forecast year, the annual change in load size (MVA) from PY25 to PY26 is divided by the total load (MVA) from the GNA/DUPR 2025 Known Load Cycle tracking dataset with a status of New or Ongoing. A positive percentage reflects an increase in load from PY25 to PY26, while a negative percentage reflects a decrease.

Annual change in number of known loads (Count and %):

Forecast Year	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Annual Change (Count)		1579	365	109	47	25	16	9	7	4	
Annual Change (%)		301.3%	201.7%	125.3%	142.4%	100%	133.3%	128.6%	116.7%	400%	

Calculation Methodology:

Annual Change (Count) – For each shared forecast year, every project with a change in load between PY25 and PY26 is counted and summed across all projects to produce the total annual change in count for that year; projects with no load change are not counted. Only known loads with a status of New or Ongoing in both the PY25 and PY26 datasets are included. A positive value reflects an increase in the number of known loads from PY25 to PY26; a negative value reflects a decrease.

Annual Change (%) – For each shared forecast year, the count of known loads with an annual change from PY25 to PY26 is divided by the total count of known loads from the GNA/DUPR 2025 Known Load Cycle tracking dataset with a status of New or Ongoing. A positive percentage reflects an increase in the number of known loads from PY25 to PY26, while a negative percentage reflects a decrease.

4. Annual Change (relative to the previous Tracking Data submitted by the utility) in total of all Known Loads and broken out by Type/Category (MVA, Count, and %)

The following metric shows the same annual change described in Metric 3, separated by type/category. It compares the current dataset (PY26) with the previous dataset (PY25), covering the forecast years present in both datasets. Only known loads with a status of New or Ongoing in both the PY25 and PY26 datasets are included.

Annual change in total of all known loads (MVA and %):

Annual Change (MVA)											
Forecast Year	**2025**	**2026**	**2027**	**2028**	**2029**	**2030**	**2031**	**2032**	**2033**	**2034**	**2035**

Calculation Methodology:

The same calculations used in Metric 3 are applied, with the results separated by type/category.

5. Service Amount Deferred (MVA and %)

The following metric measures how much load size moved to a later year from the previous dataset (PY25) to the current dataset (PY26). A load is considered "deferred" when it appears in both the PY25 and PY26 datasets with a later in-service year. Only known loads with a status of New or Ongoing in both the PY25 and PY26 datasets are included. Deferrals are grouped into three types based on how a project's timing shifted:

Deferred 1 – The project's final (last) load year moved to a later year in PY26.

Deferred 2 – The project's initial (first) load year moved to a later year in PY26.

Deferred 3 – Both the initial and final load years moved to later years in PY26.

	Grand Total	Deferred 1	Deferred 2	Deferred 3
Service Amount Deferred (MVA)	1866.0	9.0	135.2	1721.8
Service Amount Deferred (%)	52.2%	0.3%	3.8%	48.2%

Calculation Methodology:

Service Amount Deferred (MVA) - For each project, the total service amount deferred is the requested load that shifted to a later year, measured against the previous dataset (PY25):

For Deferred 1, it is the requested load in PY26 beyond the project's final load year in PY25.

For Deferred 2, it is the requested load in PY26 beyond the project's initial load year in PY25.

For Deferred 3, it is the requested load for both initial and final load years in PY26.

Service Amount Deferred (%) - For each deferral type, the percentage is the service amount deferred (MVA) divided by the total load (MVA) from the GNA/DUPR 2025 Known Load Cycle tracking dataset with a status of New or Ongoing.

6. Service Deferral Rate Total (Count and %)

This metric measures the count of known load projects that moved to a later year from the previous dataset (PY25) to the current dataset (PY26). It uses the same deferral definitions as Metric 5 (Deferred 1, Deferred 2, and Deferred

3), but counts the number of deferred projects rather than summing their load. Only known loads with a status of New or Ongoing in both the PY25 and PY26 datasets are included.

	Grand Total	Deferred 1	Deferred 2	Deferred 3
Service Amount Deferred (Count)	1200	6	117	1077
Service Amount Deferred (%)	60.6%	0.3%	5.9%	54.4%

Calculation Methodology:

Service Amount Deferred (Count) - For each deferral type, the number of projects classified in that type is counted.

Service Amount Deferred (%) - For each deferral type, the percentage is the count of deferred projects divided by the total count of known loads from the GNA/DUPR 2025 Known Load Cycle tracking dataset with a status of New or Ongoing. A higher percentage reflects a greater share of comparable projects moving to a later year from PY25 to PY26.

7. Service Deferral Rate by Type/Category (Count and %)

The following metric shows the same deferral counts described in Metric 6, separated by type/category. It uses the same deferral definitions and compares the prior dataset (PY25) with the current dataset (PY26). Only known loads with a status of New or Ongoing in both the PY25 and PY26 Tracking Datasets are included.

	Service Amount Deferred (Count)		
	Deferred 1	Deferred 2	Deferred 3

MD/HD EV	0%	0%	73.8%

Calculation Methodology:

The same calculations used in Metric 6 are applied, with the results separated by type/category.

8. Cancellation Rate Total (%)

The following metric measures the number of tracked known load projects that were canceled between the previous dataset (PY25) and current dataset (PY26).

Cancellation Rate Total	6.3%

Calculation Methodology:

The cancellation rate total is the count of known loads with a status of Canceled status of Canceled divided by the total count of known loads from the GNA/DUPR 2025 Known Load Cycle tracking dataset with a status of New or Ongoing.

9. Cancellation Rate by Type/Category (%)

The following metric shows the same cancellation rate described in Metric 8, separated by type/category.

	Cancellation Rate
Agriculture	4.5%
Commercial	5.5%
Education	6.1%
Health Care	7.4%
Business	6.4%
Other	4.4%
Industrial	8.1%
Plants	2.5%
Facilities	0%
Cultivation	12.0%
Other	0%
Residential	3.8%
Home Construction	3.6%
Other	5.1%
Transportation	9.5%
LD EV	10.0%
MD/HD EV	8.7%

Calculation Methodology:

The same calculations used in Metric 8 are applied, with the results separated by type/category.

10. Service Request Amount Increase Rate Total and Average Amount (MVA, Count, and %)

The following metric measures how much the requested load grew for known load projects whose amount went up from the previous dataset (PY25) to the current dataset (PY26). Only known loads with a status of New or Ongoing in both the PY25 and PY26 tracking datasets are included.

Increased Known Load Amount (MVA)	182.7
Known Load Amount Increase Rate (%)	5.1%
Count of Known Loads whose amount increased	114
Average Service Amount Increase (MVA)	1.6

Calculation Methodology:

For all known load projects whose service request amount increased from PY25 to PY26 (excluding projects without load in either PY25 or PY26, such as new, canceled, or energized projects), the total increase in service request amounts — that is, the sum of all positive year-over-year differences — is added together to produce the Increased Known Load Amount (MVA). The Known Load Amount Increase Rate (%) is that total increase divided by the sum of the PY25 service request amounts for the same set of projects. The Average Service Amount Increase is the total increase divided by the number of projects whose amount increased.

11. Service Request Amount Increase Rate by Type/Category and Average Amount (MVA, Count, and %)

The following metric shows the same increase measures described in Metric 10, separated by type/category. Only known loads with a status of New or Ongoing in both the PY25 and PY26 tracking datasets are included.

Type/Category	Increase Known Load Amount (MVA)	Known Load Amount Increase Rate (%)	Count of Known Loads whose amount increased	Average Service Amount Increase (MVA)
Agriculture	1.7	3.3%	1	1.7
Commercial	24.3	2.5%	26	0.9
Education	0	0%	0	0
Health Care	2.6	7.5%	1	2.6
Business	4.9	1.5%	13	0.4
Other	16.8	3.0%	12	1.4
Industrial	11.2	2.6%	9	1.2
Plants	3.7	2.3%	3	1.2
Facilities	0	0%	0	0
Cultivation	7.5	3.5%	5	1.5
Other	0	0%	1	0
Residential	111.1	11.9%	28	4.0
Home Construction	110.2	12.6%	27	4.1
Other	0.9	1.6%	1	0.9
Transportation	34.4	2.9%	50	0.7
LD EV	19.7	3.1%	26	0.8
MD/HD EV	14.7	2.6%	24	0.6

Calculation Methodology:

For each category or type, and for all known load projects in that group whose service request amount increased from PY25 to PY26 (excluding projects without load in either PY25 or PY26, such as new, canceled, or energized projects), the total increase in service request amounts — that is, the sum of all positive year-over-year differences — is added together to produce the Increased Known Load Amount (MVA). The Increase Rate (%) is that total increase divided by the sum of the PY25 service request amounts for the same set of projects in that group. The Average Increase (MVA) is the total increase divided by the number of projects in that group whose amount increased. A higher rate reflects greater growth in requested load from PY25 to PY26.

12. Service Request Amount Decrease Rate Total and Average Amount (MVA, Count, and %)

The following metric measures the decrease in load amount for known load projects whose load amount went down from the previous dataset (PY25) to the current dataset (PY26). Only known loads with a status of New or Ongoing in both the PY25 and PY26 tracking datasets are included.

Decreased Known Load Amount (MVA)	-368.3
Known Load Amount Decrease Rate (%)	-10.3%
Count of Known Loads whose amount decreased	352
Average Service Amount Decrease (MVA)	-1.0

Calculation Methodology:

For all known load projects whose service request amount decreased from PY25 to PY26 (excluding projects without load in either PY25 or PY26, such as new, canceled, or energized projects), the total decrease in service request amounts — that is, the sum of all negative year-over-year differences — is added together to produce the Decreased Known Load Amount (MVA). The Known Load Amount Decrease Rate (%) is that total decrease divided by the sum of the PY25 service request amounts for the same set of projects. The Average Service Amount Decrease is the total decrease divided by the number of projects whose amount decreased. A more negative rate reflects a greater reduction in requested load from PY25 to PY26.

13. Service Request Amount Decrease Rate by Type/Category and Average Amount (MVA, Count, and %)

The following metric shows the same decrease measures described in Metric 12, separated by type/category. Only known loads with a status of New or Ongoing in both the PY25 and PY26 tracking datasets are included.

Type/Category	Decreased Known Load Amount (MVA)	Known Load Amount Decrease Rate (%)	Count of Known Loads whose amount decreased	Average Service Amount Decrease (MVA)
Agriculture	-2.6	-5.0%	19	1.7
Commercial	-98.3	-10.3%	90	0.9
Education	-2.4	-7.0%	5	-0.5
Health Care	-2.4	-6.9%	4	-0.6
Business	-42.6	-12.9%	42	-1.0
Other	-51.0	-9.1%	39	-1.3
Industrial	-32.7	-7.5%	29	1.2
Plants	-11.8	-7.3%	14	-0.8
Facilities	-10.3	-25.7%	4	-2.6
Cultivation	-10.5	-5.0%	11	-1.0
Other	0	0%	0	0
Residential	-145.4	-15.6%	123	4.0
Home Construction	-142.2	-16.2%	116	-1.2
Other	-3.2	-5.4%	7	-0.5
Transportation	-89.3	-7.5%	91	0.7
LD EV	-39.9	-6.3%	58	-0.7
MD/HD EV	-49.4	-8.8%	33	-1.5

Calculation Methodology:

For each category or type, and for all known load projects in that group whose service request amount decreased from PY25 to PY26 (excluding projects without load in either PY25 or PY26, such as new, canceled, or energized projects), the total decrease in service request amounts — that is, the sum of all negative year-over-year differences — is added together to produce the Decreased Known Load Amount (MVA). The Decrease Rate (%) is that total decrease divided by the sum of the PY25 service request amounts for the same set of projects in that group. The Average Decrease (MVA) is the total decrease divided by the number of projects in that group whose amount decreased. A more negative rate reflects a greater reduction in requested load from PY25 to PY26.

6. Pending Load Projects Overview

This section describes how SCE incorporated pending loads into its distribution planning process for the 2025–2026 planning cycle. Pending loads represent expected future demand, of various confidence levels, that has not yet materialized as formal customer energization requests but reflects a higher likelihood than long-term baseline forecasts. Pending loads enhance mid-term planning years (years 4-7) visibility of load growth and inform proactive identification of potential grid needs.

6.1. Pending Load Inputs and Data Sourcing

SCE develops pending load inputs from multiple internal and external sources that provide early indications of future customer demand. These sources include early customer engagement, transportation electrification planning efforts, local development signals, and other third-party or publicly available datasets.

As part of this process, SCE incorporated targeted bottom-up analyses to capture emerging load growth that may not be reflected through traditional forecasting approaches. These efforts include transportation electrification analyses, including truck stop infrastructure assessments from the West Coast Clean Transit Corridor Initiative[24] and medium- and heavy-duty vehicle electrification forecasts developed using Guidehouse's Transportation Electrification Proactive Planning Framework.[25] Additionally, SCE incorporated port-related electrification initiatives and identification of residential and commercial development projects associated with permitting activity (i.e., California Environmental Quality Act (CEQA) database).

To support integration into the planning process, SCE feeds the pending loads into the minimum criteria framework to assign the proper categorization based on expected timing, magnitude, and geographic location certainty. Once these loads are under their respective category (A, B1, B2 or C), additional guardrails (i.e. hot spots and IEPR caps) get applied to further mitigate the certainty level of these loads materializing

These pending load inputs provide an additional layer of granularity, particularly in the mid-term portion of the planning horizon where traditional inputs may be limited and support earlier identification of potential system impacts.

6.2. Pending Load Reporting and Metrics

SCE represents pending loads in its planning outputs through a set of standardized attributes intended to support transparency and tracking of these loads eventually becoming known loads. These attributes include information related to load magnitude, expected in-service timing, location within the distribution system, the originating source of the data, and how that load's confidence levels increase throughout planning cycles by becoming higher levels of pending loads and eventually known loads.

---

[24] West Coast Clean Transit Corridor Initiative, *Final Report: Interstate 5 Corridor California, Oregon, Washington* (June 2020).

[25] Guidehouse, Transportation Electrification Proactive Planning (TEPP), developed pursuant to the CPUC's Proactive Planning Framework for Transportation Electrification.

Pending loads are tracked and maintained as part of the annual distribution planning cycle, allowing SCE to monitor how these inputs evolve over time. As part of this process, SCE aligns pending load data with existing planning datasets and reporting structures to help ensure consistent treatment across planning cycles. This approach enables comparison between planning assumptions and observed outcomes in subsequent cycles, supporting ongoing refinement of forecasting inputs.

Pending load reporting is designed to provide visibility into the underlying data sources and assumptions used in planning while remaining consistent with the overall structure of the GNA and DUPR datasets.

Pending Load categories and minimum criteria were formally established in December 2025. As a result, pending load data from prior forecasting cycles is not directly comparable to the current planning year due to the introduction of a standardized framework. Accordingly, metrics that compare current Plan Year Pending Load data with prior Plan Year results are not included in this report.

Metrics 1:

Total MVA of Pending Load by year:

Forecast Year	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Sum of Load Amount (Cat. A)	812.4	663.5	319.0	203.1	129.5	66.9	62.4	26.0	16.6	5.3
Sum of Load Amount (Cat. B1)	0.0	853.4	343.1	451.4	199.7	149.8	134.9	55.0	55.0	27.1
Sum of Load Amount (Cat. B2)	0.0	73.4	33.5	34.7	42.0	62.2	44.6	18.0	16.9	18.1
Sum of Load Amount (Cat. C)	0.0	0.0	0.0	0.0	124.8	0.0	2.6	118.2	103.1	44.2

Methodology: For each forecast year in PY2026, the projected load (MVA) of all qualifying Pending Load projects within each category is aggregated to calculate the total Pending Load demand for that year.

Number of Pending Load by year:

Forecast Year	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Count of Pending Load (Cat. A)	415	281	137	74	48	24	16	11	7	1
Count of Pending Load (Cat. B1)	0	342	198	572	406	341	323	56	65	15
Count of Pending Load (Cat. B2)	0	13	13	22	19	18	18	16	17	17
Count of Pending Load (Cat. C)	0	0	0	0	51	0	156	197	180	180

Methodology: For each forecast year in PY2026, the number of qualifying Pending Load projects within each category is aggregated to determine the total number of Pending Loads for that year.

6.3. Hot Spot Identification

SCE uses pending load data to identify “hot spots,” in alignment with Resolution E-5413, which are geographic areas where concentrated load growth is anticipated and where system capacity constraints are more likely to emerge. These areas are identified through the aggregation of pending load inputs in combination with existing system conditions and forecasted demand.

Hot spot identification serves as a screening tool within the planning process, allowing SCE to focus analysis on locations with elevated growth expectations and capacity constraints, thus this process supports earlier identification of grid needs and informs subsequent planning activities. Hot spot designation determines where pending load growth is and is not allowed to exceed the IEPR cap, as described in Section 4.3 and Figure 4.

The use of pending loads in defining hot spots enables SCE to incorporate localized growth signals that may not be fully reflected in baseline forecasts. As a result, hot spots provide a targeted view of potential system impacts and support more informed planning decisions within the broader distribution planning framework.

7. GNA Overview

The GNA presents the electric system needs identified through SCE's annual Distribution and Subtransmission Planning Processes. As described in Section 3, SCE develops long-term load and DER forecasts, evaluates forecasted system conditions across multiple planning scenarios, and assesses whether existing facilities can continue to operate within established planning criteria. These assessments are performed across both the distribution system and the subtransmission system, where forecasted demand growth, DER adoption, and changing system conditions may create future capacity, reliability, resiliency, or voltage support needs. Additionally, starting with the 2025-2026 planning cycle, grid needs were identified across Low, Base, and High planning scenarios. This section provides a high-level description of the data contained in SCE's 2026 GNA report.

7.1. DER Distribution Services

- **Capacity Services:** These services are required to reduce net demand during peak conditions such that equipment does not exceed capacity ratings. SCE also considers underground cable temperature (UCT) needs within the capacity category. UCT needs result from high loading on a circuit(s) located within an underground conduit where increased heat impact can damage and cause equipment failure. UCT needs are driven by the mutual heating impact of all the circuits sharing an underground structure and conduit pathway. UCT needs do not allow a direct comparison of forecasted net demand with the equipment rating and require simulations.
- **Reliability Services (Back-Tie):** This service provides a fast reconnection and availability of excess reserves to reduce demand via back-tie when restoring customers during abnormal configurations. This service provides capacity and/or voltage support during outage conditions such that grid configuration allows customers to continue to be reliably and safely energized from SCE's distribution grid. Under Normal-1 (N-1) outage conditions, grid needs may require either capacity or voltage support.
- **Resiliency Services (Microgrid):** This service provides a fast reconnection and availability of excess reserves to serve customers through a microgrid configuration during abnormal or outage conditions. Microgrids serve customers while isolated from the bulk electric system.
- **Voltage Support Services:** Dynamic voltage management services to dynamically correct excursions outside voltage limits established by Rule 2[26] as well as supporting conservation voltage reduction strategies in coordination with utility voltage/reactive power control systems. SCE further specifies the type of voltage support services as either voltage or reactive power.

[26] SCE Tariff Books, *Rule 2: Description of Services* (*available at* https://www.sce.com/regulatory/tariff-books/rules).

7.2. Summary of Grid Needs

This section provides a set of tables summarizing data contained in SCE's 2026 GNA report.

TABLE 5: SUMMARY OF GRID NEEDS BY DISTRIBUTION SERVICE TYPE GROUPED BY SCE REGION

Region	Capacity	Capacity (UCT)	Reactive Power	Reliability, Capacity	Reliability, Voltage	Voltage	None	Total
Desert	128	147	12	31	5	8	41	**372**

7.3. Understanding the Grid Needs Assessments Report

The GNA includes forecasted equipment deficiencies, incremental demand, and incremental DER growth for each circuit and distribution substation with a grid need over a five-year forecast horizon. Three worksheets are included within the GNA report:

- Grid Needs Assessment (GNA)
- Planning Assumptions_Feeder
- Planning Assumptions_DistSub

The "Planning Assumptions_Feeder" worksheet and the "Planning Assumptions_DistSub" worksheet contain a 10-year load and DER forecast for SCE's distribution circuits and distribution substations. The "Facility Loading Limit" column represents the MW value at which the representative facility can be safely operated to serve load for the specified year of the forecast. The "Total DER Growth" column for the feeder worksheet is a summation of DER

growth for the feeder for the specified year of the forecast. These include the DERs reported within the feeder-level planning assumptions sheet. As a point of clarification, the EV DER column is a summation of all TE categories as covered within Table 15. Similarly, the "Total DER Growth" column for the substation worksheet is a summation of DER growth for all downstream circuits of the representative facility for the specified year of the forecast. These include the DERs reported within the distribution substation-level planning assumptions sheet.

In the “Grid Needs Assessment (GNA)” sheet, the "Equipment Rating" column for a facility is the absolute minimum rating over the ten years for the corresponding asset. When a single facility has multiple projects developed and presented in the DUPR (e.g., due to a different timeframe of the needs), the lowest rating over the ten years is utilized. In addition, when a single asset has multiple projects included in the DUPR, the operating date for this asset presented in the “Grid Needs Assessment (GNA)” sheet is the earliest operating date of the corresponding project in the DUPR.

8. DUPR Overview

This section provides a high-level overview of the data presented in SCE’s 2026 DUPR. The DUPR outlines SCE’s Planned Investments and Planned Solutions designed to address grid needs identified in the GNA report. SCE’s DUPR represents a point-in-time snapshot of all Planned Investments and Planned Solutions as of the conclusion of SCE’s annual DPP. Any updates or changes occurring after the DPP’s completion are not reflected in the DUPR. To align with the newly adopted Project Execution template, projects that include both distribution and substation components are reported separately in the 2026 DUPR. Previously, such projects were consolidated and presented as a single entry.

8.1. Planned Investments vs Planned Solutions

The GNA forms the basis for the DUPR report. A single Planned Investment or Planned Solution may mitigate multiple grid needs identified in the GNA.

Planned Investments refer to distribution planning projects approved to address grid needs that have been submitted for execution. Planned Solutions are proposed distribution planning solutions that are not yet scheduled to be released for execution. A Planned Solution can potentially become a Planned Investment in the future if it is submitted for project execution. A Planned Investment, once submitted, may be subject to deferral based on resource constraints or strategic planning priorities.

8.2. Scenario Planning for PY26 Project Identification

8.2.1. Scenario Planning Overview

In Decision (D.) 24-10-030 and Resolution E-5414, the CPUC adopted a scenario-based forecasting and planning framework for Grid Needs Assessments. Scenario planning is intended to improve visibility into forecast uncertainty, support timely customer energization, and develop a single investment plan from a range of potential future load growth outcomes while balancing grid readiness and affordability objectives

Because electrification adoption, economic development, and customer energization activities may occur at varying rates, future load growth is inherently dynamic. Evaluating multiple load growth scenarios allows SCE to assess a

range of plausible future outcomes, identify both near-term grid needs and make investment decisions that remain effective under a range of potential futures.

Consistent with the Commission-adopted framework in Resolution E-5414, SCE developed Low, Base, and High forecast scenarios and evaluated grid needs under each scenario for the 2025-2026 plan cycle. The results of these assessments were then used to inform the development of a single integrated distribution and subtransmission investment plan.

8.2.2. Scenario Development Methodology

The three scenario forecasts build upon the forecasting methodology described in Section 4.3, including customer demand forecasts, electrification projections, pending load information, and the application of the IEPR cap logic.

Pending loads were incorporated using the Commission-adopted pending load categorization framework, which differentiates loads according to their level of development maturity and probability of occurrence.

Three forecast scenarios were developed:

- Low Scenario – Represents a conservative load growth outlook that includes only the highest-confidence pending loads.
- Base Scenario – Represents the most likely future load growth outcome and serves as the primary planning forecast.
- High Scenario – Represents accelerated load growth and electrification adoption and is used to evaluate potential future constraints and opportunities for proactive planning.

Together, these scenarios provide a structured framework for evaluating the sensitivity of identified grid needs to varying levels of future load growth.

8.2.3. Scenario-Informed Decision Framework

Resolution E-5414 requires utilities to establish a transparent method for translating multiple forecast scenarios into a single investment plan. SCE applied a scenario-informed decision framework, per the Resolution, that evaluates the extent to which identified grid needs appear across the Low, Base, and High scenarios. Grid constraints that appear consistently across the Low, Base, and High scenarios indicate a higher likelihood that the need will materialize and therefore provide greater confidence in the associated investment recommendation. SCE evaluated whether higher-growth conditions would result in additional constraints at the same location and whether modifications to project scope, sizing, or timing could efficiently accommodate a broader range of future load outcomes.

The Base Scenario serves as the primary planning scenario and establishes the initial set of projects. The Low Scenario provides insight into the confidence associated with identified needs and is used to prioritize investments. The High Scenario is used to evaluate future growth risks and assess whether proactive planning measures may provide long-term customer benefits. This scenario is used to augment the investment plan where needed and reasonable.

8.2.3.1. CONSISTENT SOLUTIONS

Consistent solutions are required across multiple forecast scenarios and therefore demonstrate a high likelihood of being needed regardless of future load growth outcomes. Because these needs are relatively insensitive to forecast uncertainty, they provide greater planning confidence and typically form the foundation of the investment plan.

8.2.3.2. INCREMENTAL SOLUTIONS

Incremental solutions emerge primarily under higher-growth scenarios and provide insight into how additional load growth may affect future system requirements. These solutions help identify opportunities to preserve flexibility, support future expansion, and reduce implementation risk if higher-growth conditions materialize

Examples of these considerations may include selecting assets that provide additional capacity, incorporating future expansion capability during project design, or advancing planning activities for locations where higher-growth scenarios indicate emerging system needs. Such evaluations are intended to reduce the risk of future rework while avoiding unnecessary near-term overinvestment.

Through this framework, scenario analysis informs not only whether an investment may be required, but also how that investment can be developed to support future system flexibility and grid readiness.

8.2.4. Distribution Decision Logic

For distribution planning, the base scenario establishes the initial set of projects. Scenario Results are then evaluated using the scenario-informed decision framework to assess confidence in identified grid needs and determine whether project scope, sizing, or timing should be adjusted to accommodate potential future growth seen in the high scenario. This evaluation supports development of distribution investments that address identified needs while preserving flexibility for future electrification and customer growth.

The table below shows examples of how to compare conceptual solutions from the Base and High Scenarios within common grid need locations and determine a planning action that considers both scenarios.

TABLE 7: SCENARIO INFORMED DISTRIBUTION EXAMPLES

Example	Base Scenario	High Scenario	Decision Logic / Planning Action	Threshold / Key Consideration
#1	No Grid Need / No-Cost Solution	Distribution Circuit Upgrade (DCU)/ New Circuit(s)	No change to Base Scenario scope. Continue with business-as-usual planning because the High Scenario need does not justify additional project scope.	No impact from High Scenario.
#2	Distribution Circuit Upgrade (DCU)	New Circuit(s)	Scope DCU within the applicable planning window. Evaluate new circuit scope only if the Base Scenario average circuit NPL is at or above 400A and the new circuit would substantially improve the DCU solution.	Substantial benefit and average circuit NPL ≥ 400A.
#3	New Circuit(s) / Substation Capacity Upgrade (SCU)	Additional Circuits	Base Scenario already supports substation-related work. Model each additional High Scenario circuit iteratively until the Base Scenario average circuit NPL drops below 400A.	Average circuit NPL ≥ 400A; 4-year window.
#4	Not applicable / High Scenario-driven	Substation Capacity Upgrade (SCU)	Scope SCU only if Base Scenario criteria utilization exceeds approximately 95% within the first 5 years of the Base Scenario system plan and the substation can physically accommodate the upgrade.	~95% utilization; 5-year window.
#5	Not applicable / High Scenario-driven	New Substation	Perform an Electrical Needs Area (ENA) study. Scope a new substation only if ENA average criteria utilization exceeds approximately 95% within 7 years of the Base Scenario system plan, after accounting for planned upgrades.	~95% utilization in ENA; 7-year window.

8.2.5. Subtransmission Decision Logic

For subtransmission planning, the base scenario establishes the initial set of projects. Scenario Results are then evaluated using the scenario-informed decision framework to assess confidence in identified grid needs and

determine whether project scope, sizing, or timing should be adjusted to accommodate potential future growth seen in the high scenario. This evaluation supports development of subtransmission investments that address identified needs while preserving flexibility for future electrification and customer growth.

The table below shows examples of how to compare high-level solutions from the Base and High Scenarios within common grid need locations and determine a planning action that considers both scenarios.

TABLE 8: SCENARIO INFORMED SUBTRANSMISSION EXAMPLES

Example	Base Scenario	High Scenario	Decision Logic / Planning Action	Key Consideration
Subtransmission Line #1	No Need	Upgrade Substation Component	Consider upgrading the limiting substation component if within the applicable scoping window and the Base Scenario need is approaching the asset loading limit.	Minimal incremental scope may be justified.
Subtransmission Line #2	Upgrade Substation Component	Reconductor	Consider upgrading the limiting substation component or performing line reconfiguration. Add reconductor scope if the High Scenario need occurs within the scoping window and/or the Base Scenario solution provides only minimal margin.	Bundling incremental scope with the base project can avoid future rework.
Subtransmission Line #3	Reconductor	Higher Ampacity Reconductor	Scope a reconductor project to address the Base Scenario need. Consider installing a higher ampacity conductor if within the applicable scoping window and/or the Base Scenario solution provides only minimal remaining margin.	Increased line rating and additional future capacity.
Transformer #1	No Need	Increase Transformer Bank Capacity	If the Base Scenario approaches 100% loading and the High Scenario exceeds 100% loading, evaluate increasing transformer bank capacity. Consider reserving space and planning for long-lead equipment.	Minimal incremental scope may be justified while preserving future expansion capability.

8.2.6. Development of Single Integrated Investment Plan

The results of the Low, Base, and High scenario assessments were collectively considered in the development of the PY26 distribution investment plan. Rather than developing separate investment portfolios for each forecast scenario, SCE used the scenario assessment results to develop a single integrated plan that reflects the most likely future system needs while considering uncertainty associated with longer-term load growth.

The resulting PY26 investment portfolio reflects SCE's application of the Commission-adopted scenario planning framework and provides a transparent, risk-informed basis for identifying distribution system investments needed to serve customers safely and reliably throughout the planning horizon.

Consistent with Ordering Paragraph 8 of D.24-10-030, for each project in the DUPR driven by the High Scenario, SCE identifies (a) the difference in project scope between the Base and High Scenarios (in MW and/or other relevant metric) and (b) the decision-logic rationale for including the project in the single set of planned investments.

Nearly all projects in the DUPR are driven by a need identified in the Base Scenario; where a corresponding need also appears in the High Scenario, project scope may be adjusted in accordance with the decision logic described in Sections 8.2.4and 8.2.5 For the 2026 DUPR, one subtransmission project is driven solely by a need identified in the High Scenario and is described below.

(a) Difference in project scope. The Base Scenario identifies no grid need on the affected but highly loaded subtransmission line. In the High Scenario, the line exceeds 100% loading in Year 10, with a Base-to-High deficiency delta of less than 3%. The incremental scope is reconductoring approximately 0.91 miles of small-gauge copper conductor.

(b) Decision-logic rationale. Although this need would ordinarily be screened out (delta under 3%; exceedance only in Year 10), the engineer proceeded based on engineering judgment, consistent with DFWG guidance permitting incremental solutions where the Base Scenario need approaches the asset loading limit. Because the line is highly loaded under the Low and Base Scenarios and the work can be bundled with other projects already in execution on the same line, the impact on the integrated investment plan is minimal.

8.3. Summary of Planned Investments and Solutions

This section provides a set of tables summarizing data contained in SCE's 2026 DUPR planned investment and solution list.

TABLE 9: SUMMARY OF PLANNED INVESTMENTS BY REGION AND BY PROJECT TYPE

Region	Project Type			
	Distribution	Distribution VAR	Subtransmission	Total
Desert Region	187	11	35	233
Metro East Region	229	0	17	246
Metro West Region	189	7	15	211
North Coast Region	54	3	5	62
North Valley Region	62	3	15	80
Orange Region	131	5	8	144
Rurals Region	71	4	24	99
San Jacinto Region	84	3	14	101
San Joaquin Region	65	0	9	74
Unassigned	97	0	10	107
Total	**1,169**	**36**	**152**	**1,357**

TABLE 10: SUMMARY OF PLANNED INVESTMENTS BY DISTRIBUTION SERVICE

Distribution Service							Total
Capacity	Capacity (UCT)	Voltage	Reactive Power	Reliability, Capacity	Reliability, Voltage	None	
1,197	1200	24	53	172	17	362	**3,025**

TABLE 11: SUMMARY OF PLANNED INVESTMENTS BY OPERATING DATE

Operating Date										
2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	Total
273	397	285	215	75	26	25	27	19	15	**1,357**

Projects included in Table 11 above are those in the current 10-year planning horizon.

8.4. Distribution Planning Prioritization

Ordering Paragraph 15 of D.24-10-030 required the IOUs to describe how projects identified throughout the distribution planning horizon have been prioritized for execution. SCE's project prioritization process is multifaceted and considers many constraints, needs, and factors including minimizing customer energization delays.

SCE employs a risk-informed and customer-focused prioritization framework to develop a portfolio of projects that address evolving customer and electric system needs while recognizing practical resource and funding constraints. The 2026 DPP identified infrastructure needs and potential projects that may exceed the available workforce, material availability, funding levels, etc. in the future. Consequently, SCE evaluates and balances multiple factors when prioritizing projects, including minimizing customer energization delays, maintaining and improving system reliability and safety, supporting regulatory and policy objectives, optimizing operational efficiency, and focusing on customer affordability.

8.5. Understanding the DUPR

SCE uses three identifiers to facilitate the linkage between the grid needs in its GNA report and the planned investments/candidate deferral projects in its DUPR.

- DUPR Project ID: a project identifier used to associate different components of a single project. For example, a single project that would mitigate needs of multiple assets might have multiple line items in the planned investments list, with each line-item mapping to a circuit that has a grid need being solved by the project. SCE cross-references the current Planned Investments with previous DUPR and DDOR reports up to 2019 when DDOR Project IDs were introduced. DUPR IDs can be either DDOR Project IDs or DUPR Project IDs depending on what year the project first appeared in the filing.
- DUPR ID: a unique identifier for each line item in the planned investments list.
- GNA ID: a unique identifier assigned in the "Grid Needs Assessment (GNA)" sheet to represent each unique line item in the "Grid Needs Assessment (GNA)" sheet. GNA ID is used for linkage purposes in the Planning Assumption sheets (feeder and substation) and DUPR report.

When cross-referencing information in SCE's GNA report and DUPR, it is important to note that the GNA report contains needs on individual assets while the DUPR contains project-based information. In some cases, multiple

projects are proposed to address one circuit's needs (e.g., due to different timeframes of the needs). In other cases, a single project is proposed to address multiple system needs. The grid needs presented in the GNA report are representative of needs that will be solved by planned investments or solutions provided in the DUPR.

There are some planned investments or planned solutions with multiple needs on the same asset. For example, a project can mitigate an asset's equipment rating exceedance as well as its UCT exceedance. Both violations can be met by the capacity service (Distribution Service Required or DSR). In these cases, the largest need is reported because the same service can solve both needs. However, if a planned investment is solving two different DSRs (such as a capacity service and voltage support service) on the same asset, these needs are listed separately in the planned investment sheet with the same project number.

According to Rule 2, secondary service voltage levels should be maintained between 0.95 per-unit voltage (Vpu) and 1.05 Vpu (i.e., within 5% of nominal voltage). For planned investments addressing voltage needs, the deficiency is listed as the actual Vpu value of the asset to avoid confusion on whether deficiency value refers to the deviation from the base (1 Vpu) or the range boundary (0.95 Vpu / 1.05 Vpu). The actual voltage deficiency of the asset is the amount less than 0.95 Vpu or the amount greater than 1.05 Vpu.

There are some planned investments with no needs in the ten-year horizon, as determined through SCE's 2026 DPP. Most of these cases occur because the projects are either already completed (with an operating date in early 2026) or in execution based on previously forecasted needs. Changes to load and DER forecasts, and resulting changes to associated grid needs, can be caused by various factors including but not limited to:

1. Change of the forecasted load and DER with the most recent IEPR forecast used in SCE's 2026 DPP.
2. Update to the baseline demand based on the latest circuit peaks observed in the previous summer period resulting in decreased values in comparison to the previous planning process.

9. Project Execution (PE) Tracking Metrics Overview

To increase transparency in the execution of distribution capacity projects and the distribution planning process, the inclusion of project execution metrics has been adopted as described in D.24-10-030. These metrics will provide additional details for distribution capacity projects as well as lead to fulfillment of Pub. Util. Code § 933.5(a)(2).

The Project Execution template is designed to capture key data throughout the lifecycle of a project. Future enhancements will include fields to document whether Actual Peak Load (adjusted to 1-in-10) from the most recent cycle on the GNA facility or facilities is higher than the rating of the original infrastructure (prior to the project's completion) and whether Forecast Peak Load (adjusted to 1-in-10) from the most recent cycle on the GNA facility or facilities is higher than the rating of the original infrastructure (prior to the project's completion) for one or more forecast years. SCE acknowledges the current limitations of our reporting approach and notes that SCE intends to evaluate and enhance its existing processes to better support this reporting effort in future filings.

10. Pre-Application and Post-Application Projects

SCE utilizes a Project Gate Review Procedure to provide oversight for major projects throughout their lifecycles. This process is composed of review milestone gates that authorize project teams to proceed with licensing and execution activities. If a project requires review pursuant to General Order (GO) 131-E, and licensing activities are internally authorized, these projects are then considered Pre-Application projects. Projects that have been filed with the CPUC

as an Application for a Permit to Construct (PTC) or Certificate of Public Convenience and Necessity (CPCN) and are undergoing review pursuant to GO 131-E are considered Post-Application projects. Table 12 lists the Pre-Application and Post-Application projects included in SCE's 2026 DUPR and their approval status.

TABLE 12: PRE-APPLICATION PROJECTS AND POST-APPLICATION PROJECTS INCLUDED IN SCE'S 2026 DUPR

Project ID/ Name	Project Type	Approval Status	DUPR Report
DDOR_2019_6092: Alberhill System Project	Post-Application	CAISO: Approval 2009 SCE: Filed third amended PEA June 2023 CPUC: Addendum to FEIR issued June 2024, CPCN approved March 2026	Planned Investments
DDOR_2019_6871: Rector – Riverway No.2 Subtransmission Line	Pre-Application	CAISO: N/A SCE: Estimated licensing activities approval June 2029	Planned Investments
DUPR_2026_8669_detailed: Timepiece Substation Project	Pre-Application	CAISO: N/A SCE: Anticipate PTC application filing 2027	Planned Investments
DDOR_2020_8256: Cal City Substation 115 kV Upgrade Project	Post-Application	CAISO: N/A SCE: PTC application filed March 2023	Planned Investments

11. Distribution Resources Plan External Portal (DRPEP)

D. 18-02-004 requested IOUs to develop a central DRP data access portal to present Integration Capacity Analysis (ICA), LNBA, GNA, and DUPR data on their corresponding circuit maps.

In the 2020 DIDF Ruling, Reform #9 required IOUs to identify the location of all approved transmission projects on the DRPEP such that the attribute data can be viewed at the same time as ICA, GNA, DUPR, and other data layers provided. SCE will display transmission projects on its DRPEP that fall under at least one of the four DER deferrable services (Capacity, Volt/VAR, Reliability (Back-Tie), Resiliency (Microgrid)) and are either CAISO approved, Commission approved or internally approved by IOU/CAISO and Commission approval not required. This year, the list includes twenty Bulk Electric System transmission projects with operating dates in 2025- 2034.

11.1. Changes in DRPEP

For the current year, updates to DRPEP affecting the GNA and DUPR layers focused primarily on nomenclature. Specifically, the transition from "DDOR" to "DUPR" has been incorporated throughout the platform and data layers, reflecting the streamlined approach to system labeling and consistency. No additional structural or data modifications to these layers have been introduced beyond this terminology update.

Per D.24-10-030, LNBA values from 2023 will continue to be displayed with a new disclaimer denoting the reasoning for the pause in LNBA data. The verbiage of the disclaimer is shown below:

“Disclaimer: As directed by Decision 24-10-030, issued October 23, 2024, this layer will not display 2024-2025 LNBA information. The CPUC (California Public Utilities Commission) has requested to remove the requirement for LNBA analysis. Any additional questions can be directed to SystemPlanningTools@sce.com."

Additionally, the DUPR layer will not display the “LNBA value” column because LNBA values are not being updated. Concurrently, the column will also be removed from the attribute table to reduce any confusion.

11.2. Utilizing SCE’s new internal grid hierarchy database for Online Circuit Maps and Associated Circuit Information

The GNA and DUPR map layers are developed using the circuit topology information from SCE’s internal grid connectivity database and will not follow ICA. When a circuit is decommissioned, the decommissioned circuit is removed from the internal grid connectivity database as a result. If this decommissioned circuit shows a need in the GNA report and is associated with a planned investment in the DUPR, it would be also removed from the GNA and DUPR map layers. On the other hand, any new circuits or circuit upgrades such as system modifications, new construction, or general data mapping will eventually be reflected in the internal grid connectivity database and will automatically be updated on the GNA and DUPR layers on DRPEP.

The GNA presents forecasted cumulative demand and DER growth on either a circuit or substation level over a 5-year forecast horizon and the resulting forecasted equipment deficiencies and thus accounts for most circuits considered under our distribution planning forecast. The ICA circuit list should not affect the number of circuits shown on both the GNA and DUPR layers going forward. The “Planning Assumptions_Feeder” and “Planning Assumptions_DistSub” sheets within the GNA report contain a list of circuits and distribution substations for which SCE applies a load and DER forecast disaggregation.

The following criteria represents the methodology to include the distribution circuits and substations in the GNA Planning Assumptions map layer:

- *Planning Assumptions_Feeder*: Only circuits that are included in both the Distribution Substation Plan and ICA circuit list.
- *Planning Assumptions_DistSub*: Substations that have downstream circuits listed in the Planning Assumptions_Feeder worksheet will be on this list.

12. Data Redaction

Pursuant to Pub. Util. Code § 8380(b) (1) and (d), D.97-10-031 and D.14-05-016, additional protections are required to protect the privacy of customer identifiable energy use under the “15/15 Rule” if: 1) there are fewer than 15 customers served by the electrical asset for which data is being displayed; or 2) the electrical asset serves a single customer whose energy use or demand exceeds 15% of the total demand that asset serves. SCE applies the 15/15 Rule to data that reflects distribution load, energy use, or demand data at a local geo-spatial level. SCE has determined that the following categories of data in the 2026 GNA and DUPR can be utilized to derive customer energy use or demand and must be redacted under the 15/15 Rule:

- Equipment Rating[27] for applicable distribution facilities in the "Grid Needs Assessment (GNA)" sheet
- Deficiency % for applicable distribution facilities, if the deficiency is presented in MW, in the "Grid Needs Assessment (GNA)" sheet and DUPR
- Cumulative Demand for applicable distribution facilities in the "Planning Assumptions_Feeder" and "Planning Assumptions_DistSub" sheets
- Facility Loading (%) for applicable distribution facilities in the "Planning Assumptions_Feeder" and "Planning Assumptions_DistSub" sheets
- Facility Loading Limit for applicable distribution facilities in the "Planning Assumptions_Feeder" and "Planning Assumptions_DistSub" sheets

SCE can perform 15/15 Rule analysis on distribution circuits contained in SCE's GNA and DUPR. However, SCE's systems are not yet set up to perform 15/15 Rule analysis for substations. Therefore, in the GNA/DUPR, substation data is assumed to violate the 15/15 Rule and will be redacted in cases where all circuits fed out of that substation fail the 15/15 Rule.

13. Requirements Fulfillment

Table 13 provides a summary of the implementation of the reforms established in the 2020 May DIDF Ruling, the 2021 DIDF Ruling, the 2022 DIDF Ruling, the 2023 DIDF Ruling, and the 2024 DIDF Ruling reforms. Many of the 2020, 2021, and 2022 reforms have been implemented, as was discussed in SCE's 2020, 2021, and 2022 GNA/DDOR Narrative and are therefore not referenced in Table 13 or in this narrative. The remaining reforms from the 2020-2022 May DIDF Rulings, as well as the new reforms from the 2023 and 2024 DIDF Rulings are discussed below. For all the requirements that are no longer applicable due to the changes directed by the Decision, SCE has added language to this effect for this year, and these items will be removed from this table in future filings.

[27] A deficiency value can be found by the following equation: [(Deficiency) = (Rating) x (Deficiency %)]. In an equation with three variables, if any two variables are known, the third variable can be calculated. SCE has chosen to redact two (Equipment Rating and Deficiency %) of the three variables to prevent back calculation of a value that could later be used in an effort to derive a customer's energy use.

TABLE 13: SUMMARY OF THE RECENT RULING REFORM IMPLEMENTATIONS

No.	Reforms	Fulfillment Description
34 (2020)	If the cost of a planned investment or deferral opportunity conflicts with the corresponding project cost reported in an IOU's same-year GRC filing, the IOU shall, in the GNA/DDOR, identify the GRC-specific cost and explain the discrepancy. Pursuant to D.18-02-004, Ordering Paragraph 2h., the discrepancy must also be presented in the GRC testimony.	Not applicable to future GNA and DUPR filings since the GNA/DUPR filings are provided annually in August and the IOU GRC applications were recently changed to May. IOUs will not be aware of cost discrepancies in their GNA/DUPR filing that precedes their GRC. Any discrepancies will be captured between the GNA/DUPR filing and SCE's GRC application in the GRC testimony.
50 (2020)	With each GNA/DDOR filing, the IOUs shall append or separately provide to Energy Division a report organized by deferral opportunity that contains itemized data on any payments made to contracted deferral projects and all spending on contingency plans for each deferral opportunity. The reporting shall include any modifications or additional details required by Energy Division. The reporting shall include all candidate deferral projects launched in a DIDF RFO since 2018 and will continue to cover this timeframe unless modified by Energy Division. Additional reporting guidelines apply on GRC filing years pursuant to D.18-02-004, Ordering Paragraph 2.dd.	SCE has provided this report with its 2026 GNA/DUPR in Attachment G.
1 (2021)	Costs related to any CPUC-required DRP data portal enhancements, incremental to GRC authorized amounts, may be tracked within the Distribution Resources Plan Memorandum Account (DRPMA).	SCE will track and recover these costs accordingly.
2 (2021)	Written questions and all replies to the IOUs during the annual DIDF cycle shall be shared with Energy Division and the service list.	SCE compiled all questions and responses when the feedback period was complete and shared them with Energy Division and the service list this year and will continue to do so in the future.
4 (2021)	IOUs shall provide to the DRP service list public, fully unlocked Excel versions of all spreadsheets in the GNA/DDORs upon filing every August 15th.	SCE will provide public, fully unlocked Excel versions of all GNA/DDOR spreadsheets upon filing the narrative.

6 (2021)	Every six months IOUs shall submit to ED a DIDF Procurement Status Report noting the status of all DIDF contracts (RFO, SOC, Partnership Pilot), expected Date of Service, any modifications made to any contracts under the DIDF. The report shall include clear tables with current DIDF contract data as well as DIDF contract data from every DIDF cycle to date (including the prior IDER Pilots). A public version shall be shared with the DPAG and a confidential version with Energy Division. The IOUs shall produce its first report on November 15th and an update six months later. The IOUs should present a draft format of the report and data field to Energy Division who will provide guidance on the contents of the report by September 30, 2021. Energy Division may alter the format and contents of the report as needed on an ongoing basis to ensure the information reported is adequate to evaluate procurement status and outcomes.	SCE submitted its status reports on November 15, 2021, May 16, 2022, November 22, 2022, April 15, 2023, November 15, 2023, and May 15, 2024. This is no longer applicable due to the cancellation of the solicitation process.
8 (2021)	The Commission shall permit the deployment date of the GNA and DDOR layers on Distribution Resource Plan Data Portals to occur by August 30th annually.	SCE will update the GNA and DUPR layers to its DRP External Portal by August 30, 2026.
1 (2022)	Delay the due date for the annual IE Report to mid-March	This is no longer applicable due to the cancellation of the solicitation process.
2 (2022)	Require thorough details on the interconnection process, including timelines, to improve transparency and decrease the associated barrier to submitting successful projects	This is no longer applicable due to the cancellation of the solicitation process.
3 (2022)	A procurement window of a minimum of 75 days should be implemented for the Standard-Offer-Contract, extending from September 15th to at least November 30th. If a second round Standard-Offer-Contract solicitation launches, the same 75-day minimum solicitation window should apply. Utilities may use a longer solicitation window.	No longer applicable due to off-ramping of the Standard-Offer-Contract Pilot.

4 (2022)	Funds not spent in any Partnership Pilot project tranche should be rolled over to the subsequent tranche. Excess funds that may remain after the full deferral period (i.e., there are no future tranches to receive the roll over) shall be returned to ratepayers. In addition, funds should be rolled over to the next tranche while maintaining the deployment (20 percent), reservation (30 percent), and performance (50 percent) payment structure. Tranche design will be reviewed in the annual DIDF reform process as pilot data becomes available.	No longer applicable due to off-ramping of the Partnership Pilot.
5 (2022)	Each utility shall develop, document, and implement a quantitative ranking method for the Standard-Offer-Contract pilot and Partnership Pilot project selection in their 2022 GNA/DDOR filings, which shall be the primary factor used for the selection of projects to pilot. Qualitative measures may also be applied by Utilities as a secondary factor but must be fully documented and described in the GNA/DDOR filing.	No longer applicable due to off-ramping of the Standard-Offer-Contract and Partnership Pilots.
6 (2022)	Utilities shall include a detailed review of known load projects in their GNA/DDOR filings, including but not limited to, types of loads, number, amounts, and timing. A summary shall also be included similar to the evaluation provided in Section 3 of the March 17, 2022 IPE Report. . . . Utilities shall collaborate with the CEC and Energy Division staff on improving the IEPR demand forecast by exchanging information on modelling and assumptions used in the utility and CEC load forecasting processes.	SCE's implementation of this reform is explained in Section 5 and provided in the Known Load Projects report in Attachment F.
7 (2022)	This ruling continues the requirement to include line section data in the GNA/DDOR filing. Stakeholders are asked to consider the continued need for this data and provide comment on this matter in the 2022/2023 DIDF cycle. Given the experience of the 2021-2022 DIDF cycle, it is reasonable to grant an extension to file the required line section data. Accordingly, if necessary, Utilities may supplement their GNA/DDOR filings with line section data and the associated analyses no later than October 15, 2022.	SCE does not yet have the software tool capability to run line segment analysis. SCE is currently developing this systematic capability so that distribution planners can run power flows to identify line segment needs. SCE is still working through challenges and design with its software vendor. Therefore, SCE will not be able to include line segment level data within its 2022 GNA and DDOR. Until SCE has fully developed this capability, SCE will continue to perform and document circuit level analyses for the GNA and DDOR.

1 (2023)	In order to make them part of the proceeding record, utilities shall be responsible for filing IE and IPE reports with the Commission and serving the reports to the service list.	SCE has and will continue to file these reports when they become available each year.
2 (2023)	The Commission has stated that the purpose of the guardrail or off-ramp provision for pilots is to determine whether the pilot should be modified or terminated and also to ensure protection of ratepayer funds. To ensure protection of ratepayer funds, the Standard-Offer-Contract pilot should not be continued, and no further solicitations should occur.	This is no longer applicable due to the cancellation of the SOC pilot.
3 (2023)	The Ruling found that sufficient data to track known loads year over year is needed to understand whether the known loads materialize and why types of customer requests lead to known loads. To accomplish this, the initial in-service date initially requested by the customer, actual load amount, actual service date, and the annual amounts of service requested are important to track. Utilities shall jointly develop a uniform list of type of customer and customer load categories and include the data in the report."	SCE's response to this requirement can be found in Section 5 of this document.
4 (2023)	Given the complexity of the tracking data submittals and the fact that the three Utilities report data differently because of differences in their business processes and IT systems, Utilities are instructed to provide a narrative summary report that includes metrics calculated by Utilities based upon utility tracking data and the implications of those metrics; this would be in addition to the tracking data.	SCE has provided extensive additional discussion in Section 5 this year to meet the requirement for a narrative summary report.

5 (2023)	Pursuant to the May 11, 2020 Ruling, Utilities are required to identify all distributed energy resources solutions planned for investor-owned utility ownership or otherwise planned for procurement but not prioritized as deferral opportunities, and are required to include an indicator that the project is excluded from prioritization. The 2023 DIDF Ruling requires an additional spreadsheet that removes projects otherwise planned for procurement or identified for utility ownership. The identification of these projects, which are not likely to be recommended for deferral, will improve the Candidate Deferral Opportunity prioritization.	This is no longer applicable due to the cancellation of the solicitation process.
2 (2024)	The amendments to the 2024-2025 Distribution Deferral Framework cycle set forth in Section 3.2 of the Ruling are adopted in regard to Known Loads and Pending Loads.	The comparison on this cycle's known loads and the previous cycles known loads with metrics of MW per year and counts by type and category. Additionally, the list of the portion of pending loads associated with Pending Loads are filed separately in Attachment F, as they are not included in the metrics per the ruling.
3 (2024)	The Partnership Pilot is discontinued. No further solicitations shall be conducted.	This is no longer applicable due to the cancellation of the solicitation process.
4 (2024)	The updated Distribution Planning Advisory Group schedule for the 2024-2025 Distribution Deferral Framework cycle is adopted.	SCE includes an updated schedule in this document.
D.24-10-030 (Oct. 23, 2024)	Referencing the 2024 ALJ Ruling that temporarily removed these, Section 2.2 of the Decision sets forth that the following sections are no longer required: • Candidate Deferral Opportunities • Prioritization Metric Workbook • LNBA Workbooks for Candidate Deferral Opportunities • LNBA Workbooks for Planned Investments • Forecast Questionnaire	SCE has removed these sections from the report.
1 (2025)	The Pending Loads Resolution E-5413 requests the adoption and use of pending loads category, as defined in the Resolution, into the 2025-2026 planning cycle and onwards.	Starting with the 2025-2026 planning cycle, SCE has incorporated its pending loads in its planning as defined per the Resolution.

Table 14Table 14 below provides a summary of all columns present in the GNA report. The table lists the attribute/field name, a brief description of the attribute/field, and the 2019/2020 May Ruling requirement for that attribute/field.

TABLE 14: GNA REPORT COLUMN REQUIREMENT FULFILLMENT AND DESCRIPTION

Attribute/Field	Brief Description	Requirement
GNA ID	A unique identifier for each line item in the *Grid Needs Assessment (GNA)* sheet. This number is assigned in the GNA sheet but used for linkage purposes in both the Planning Assumptions sheets and DUPR.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.c. • Attachment A: All Other Grid Service Needs 2.a.
Substation / Subtransmission Line	Defines the level of the electrical hierarchy at which the corresponding needs have been identified.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.d. • Attachment A: All Other Grid Service Needs 2.b.
Circuit		
Distribution Service Required	Types of distribution service related to the services adopted by D.16-12-036: Capacity, Voltage including Reactive Power, Reliability, and Resiliency	The 2019 May Ruling: • Attachment A: All Other Grid Service Needs 2.d.
Primary Driver of Grid Need	Defines whether the identified grid need is *primarily* driven by[28]: • DER growth • Demand Growth	Ordering Paragraph No. 7 of D.18-03-023, DRP Track 3, Sub-track 2 Final Decision
Operating Date	The date on which traditional infrastructure must be constructed and energized, in advance of the forecasted grid need to maintain safety and reliability.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.j. • Attachment A: All Other Grid Service Needs 2.e.
Equipment Element	Defines the category of equipment.	The 2019 May Ruling: • Attachment A: All Other Grid Service Needs 2.f.
Equipment Rating	Defines the equipment's lowest rated capacity without any planned investments.	
Equipment Units	Defines the equipment's corresponding units.	
Deficiency (MW, MVAR, or V_{pu})	The GNA deficiencies are a summary of the summation of the needs for each circuit, substation, and subtransmission line listed in the DUPR Planned Investments. The deficiency % is the deficiency divided by the lowest rating in that year.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.i.
Deficiency (%)		The 2019 May Ruling: • Attachment A: GNA Datasets 1.h. • Attachment A: All Other Grid Service Needs 2.h.
Facility	Defined as *Substation* above for Planning Assumptions_DistSub sheet. Defined as *Circuit* above for Planning Assumptions_Feeder sheet.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.d. • Attachment A: All Other Grid Service Needs 2.b.

[28] SCE notes Equipment Replacement, Other factor(s), and Combination of factors were drivers not historically used in the categorization of grid needs, but were initially referenced in SCE Advice 3787-E.

GNA ID	A unique identifier for each line item in the *Grid Needs Assessment (GNA)* sheet. This number is assigned in the GNA sheet but used for linkage purposes in both the Planning Assumptions sheets and DUPR	The 2019 May Ruling: • Attachment A: GNA Datasets 1.c. • Attachment A: All Other Grid Service Needs 2.a.
Base Demand (MW)	Represents the cumulative annual load growth combined with time of use impacts (not including DER growth).	The 2019 May Ruling: • Attachment A: GNA Datasets 1.a.
Cumulative Demand (MW)	Represents the cumulative forecasted demand that would need to be served by SCE's assets. This is the forecasted peak load that is temperature adjusted to the current approved weather design criteria.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.f. • Attachment A: GNA Datasets 1.g.
Facility Loading (%)	Represents the criteria utilization of the facility.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.e. • Attachment A: All Other Grid Service Needs 2.g.
Facility Loading Limit (MW)	Represents the facility rating after all projects are in-service.	Added to facilitate use of GNA data within the IDER Avoided Cost Calculator.[29]
Residential PV (MW)	Represents the cumulative annual CEC AC nameplate of PV resources for a given facility, split out between residential and non-residential. This is the amount of PV that coincides with the anticipated time of the facility's peak.	The 2019 May Ruling: • Attachment A: GNA Datasets 1.b.iii.
Non-Residential PV (MW)		The 2019 May Ruling: • Attachment A: GNA Datasets 1.b.iv.
EE (MW)	Represents the cumulative annual energy efficiency savings that coincide with the anticipated time of the facility's peak.	The 2019 May Ruling: Attachment A: GNA Datasets 1.b.i.
EV (MW)	Represents the cumulative annual amount of EV load that coincides with the anticipated time of the facility's peak.	The 2019 May Ruling: Attachment A: GNA Datasets 1.b.v.
TE (MW)	Represents the cumulative demand of the additional pending EV load that coincides with the anticipated time of the facility's peak.	Added to facilitate use in GNA as it aligns with current and future planning processes
ES (MW)	Represents the cumulative annual amount of energy storage that coincides with the anticipated time of the facility's peak.	The 2019 May Ruling: Attachment A: GNA Datasets 1.b.vi.
Total DER Growth (MW)	Represents the total cumulative DER growth that coincides with the anticipated time of the facility's peak.	Added to facilitate use of GNA data within the IDER Avoided Cost Calculator.[30]

[29] CPUC, "Energy Division Staff Proposal for 2020 Avoided Cost Calculator Update," Final April 16, 2020 (*available at* https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M334/K786/334786698.pdf).

[30] *Ibid.*

Table 15Table 15 provides a summary of all columns present in the DUPR. The table lists the attribute/field name, a brief description of the attribute/field, and the regulatory requirements for that attribute/field.

TABLE 15: DUPR REPORT COLUMN REQUIREMENT FULFILLMENT AND DESCRIPTION

Attribute/Field	Brief Description	Requirement
Planned Investments		
GNA ID	A unique identifier for each line item in the *Grid Needs Assessment (GNA)* sheet. This number is assigned in the GNA sheet but used for linkage purposes in the Planning Assumptions sheets, DUPR and Project Execution (PE) Table.	The 2019 May Ruling: Attachment A: Project Specific DUPR data- Planned Investments 1.a. The 2020 May Ruling: Reform #18 Decision 24-10-030, issued October 23, 2024
DUPR ID	A unique identifier for each line item in the *Planned Investments* sheet.	
DUPR Project ID	A project identifier used to associate different components of a single project.	
Substation/Subtransmission Line	Defines the level of the electrical hierarchy for which a project and/or a need has been identified.	
Circuit		
Distribution Service Required	Types of distribution service related to the services adopted by D.16-12-036: Capacity, Voltage including Reactive Power, Reliability, and Resiliency	The 2019 May Ruling: Attachment A: Project Specific DDOR data- Planned Investments 1.b.
Project Description	High level description of the project's scope using standardized language	The 2019 May Ruling: Attachment A: Project Specific DDOR data- Planned Investments 1.a.
Project Description (Additional Information)	Complementary field to "Project Description" which offers an added level of detail	
Type of Equipment to Be Installed	The major equipment categories for the project	The 2019 May Ruling: Attachment A: Project Specific DDOR data- Planned Investments 1.c.

Operating Date	The date on which traditional infrastructure must be constructed and energized to maintain safety and reliability.	The 2019 May Ruling: Attachment A: Project Specific DDOR data- Planned Investments 1.d.
Deficiency (MW, MVAR, or V_{PU})	The deficiencies are the needs being fulfilled by the proposed project for each circuit, substation, and subtransmission line listed in the Planned Investments and Candidate Deferrals.	Decision (D.) 18-02-004: 3.4.1.3 DDOR Contents- Planned Investments 4.
Deficiency %	The deficiency % is the deficiency divided by the equipment rating.	
Residential Customer Commercial Customer Industrial Customer Agricultural Customer Other Customer	Provides a customer type breakdown via count for the circuit, substation or subtransmission line associated with a specific planned investment.	The 2019 May Ruling: Attachment A: Project Specific DDOR data- Planned Investments 1.f.
AACE Level of Cost Estimate	Equivalent AACE classifications of cost estimate for each planned investment by correlating SCE's business processes and AACE classifications.	SCE has removed these sections from the report.
Project History	Identifies all projects included in prior DIDF cycles starting in 2019.	The 2021 June Ruling: Reform #7
Notes	Field utilized to record additional facts or topics for the specific planned investment not already captured elsewhere. The approval status of Pre-Application and Post-Application projects is presented here.	The 2020 May Ruling Reforms #33 and 37
