Appendix 4: 2018 Grid Needs Assessment Results - Detail

1. Distribution Resources Plan Objectives and Background

On August 14, 2014, the Commission instituted Rulemaking (R.) 14-08-013 to establish policies, procedures, and rules to guide the California Investor-owned Utilities (IOUs) in developing their Distribution Resources Plan (DRP) proposals. This rulemaking also established new polices to evaluate the IOUs' existing and future electric distribution infrastructure and planning procedures with respect to incorporating Distributed Energy Resources (DERs) into the planning and operations of their electric distribution systems.

In July 2015, California IOUs each submitted their respective DRP proposals to the Commission. The Commission organized the review of the DRP filing content into three tracks: Track 1 – Tools and Methodologies, Track 2 – Field Demonstration Projects and Track 3 – Policy Issues. Various DRP working group meetings and workshops were held to inform the Commission and stakeholders, which ultimately led to several decisions in R.14-08-013.

In February 2018 the Commission issued D.18-02-004 on Track 3 Policy Issues, sub-track 1 (Growth Scenarios) and sub-track 3 (Distribution Investment and Deferral Process). This decision directed the IOUs to file a Grid Needs Assessment (GNA) by June 1 of each year, and a Distribution Deferral Opportunity Report (DDOR) by September 1 of each year.[1] This report fulfills the requirement associated with the Grid Needs Assessment (GNA) and serves as an annual report that is not subject to Commission approval.

1.1 Objectives of the Distribution Grid Needs Assessment (GNA)

The objective of the GNA is to provide transparency into the assumptions and results of the distribution planning process that yield the candidate deferral shortlist, proposed grid modernization investments, and proactive hosting capacity upgrades proposed to accommodate forecast distributed energy resource (DER) growth. PG&E's initial GNA presents preliminary data available regarding PG&E's projected distribution grid needs over a five-year planning horizon.

A full GNA will be provided in 2019. This initial GNA in 2018 will allow DRP stakeholders an opportunity to gain familiarity with PG&E's projected distribution grid needs, in advance of future solicitations for distribution deferral opportunities. As this is the first annual GNA submission, PG&E anticipates refinement and evolution of the methods and processes used in developing the GNA to occur over time in response to stakeholder and Commission feedback. As an example, PG&E anticipates the GNA and DDOR will be used to develop inputs to the Integrated Resource Plan's (IRP's) long-term resource plan optimization; however, the specific data needs associated with this use case have not yet been determined.

PG&E notes also that the information in this GNA represents PG&E's best information currently available on its electric distribution system, and is subject to change, including updates based on changes in forecast system and local loads; priorities for emergent work on electric

[1] D.18-02-004 O.P. 2.d.

distribution facilities generally; and the results of PG&E's rate cases, including the upcoming 2020 General Rate Case.

1.2 Regulatory Timelines associated with the GNA and DIDF

Stakeholders will have the opportunity to provide comments 30 days after PG&E's GNA submission on June 1.

This initial stakeholder feedback will inform PG&E's Distribution Deferral Opportunity Report (DDOR) that identifies locations on PG&E's electric distribution grid where DERs are being considered for distribution investment deferral. The DDOR is required to be filed by September 1 of each year and provided to the Distribution Planning Advisory Group (DPAG)[2] for review and comment.

After PG&E files the DDOR and provides it to the DPAG, PG&E is required to initiate DPAG meetings by September 15 or earlier. The DPAG will have up to 6 weeks to complete its review and provide its input to PG&E.

By December 1 of each year or earlier, PG&E will file a Tier 2 Advice Letter requesting approval of the distribution deferral projects that were a result of the DDOR reviewed by the DPAG. Within 30 days of the Commission's disposition of this Tier 2 Advice Letter, PG&E will launch Competitive Solicitation Request-for-Offers (RFOs) for the identified distribution deferral projects.

In summary, the regulatory timelines associated with the GNA, DDOR and Competitive Solicitations are:

- June 1: Publish Distribution Grid Needs Assessment (e.g. projected five-year distribution grid assessment)
- September 1: Distribution Deferral Opportunities Report (e.g. draft short list of distribution deferral locations) to the Distribution Planning Advisory Group
- September 15: PG&E to initiate DPAG meetings by 9/15 or earlier. DPAG will have 6 weeks to complete review and provide input to PG&E
- December 1: PG&E to file advice letter with final list of distribution deferral locations that PG&E plans to solicit via competitive RFOs
- 30 days after AL is approved: PG&E issues RFOs[3]

Collectively, this process laid out in D.18-02-004 and summarized in Figure 1 below is referred to as the Distribution Infrastructure Deferral Framework (DIDF).

[2] As described in D.18-02-004, the DPAG is an advisory stakeholder group which helps determine which distribution deferral opportunities should be pursued through solicitation of DER non-wires solutions.
[3] This procedural schedule is subject to change due to unanticipated delays, including delays in required Commission approvals.

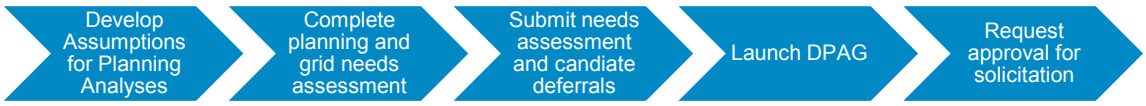

Figure 1: High Level Summary of Distribution Resources Planning Process

2. PG&E's Distribution Resources Planning Assumptions and GNA Scope

The following sections describe the study methodology and assumptions used to forecast and identify distribution grid needs in PG&E's 2018 GNA submittal that inform the potential for DER distribution deferral solutions and the need for DER hosting capacity upgrades. These assumptions include: distribution planning horizon studied, load forecast assumptions, DER growth forecast assumptions, and distribution operational switching/load transfer assumptions, and the technical criteria for identifying grid needs in the GNA.

2.1 PG&E's Distribution Resources Planning Horizon

To align with the circuit-level planning assumption requirements provided in D.18-02-004 Section 3.4.1.1, PG&E used a five-year forecast as the study horizon for identifying grid needs. For the 2018 GNA submittal, PG&E provides the assessment for the five-year planning horizon for the years 2018 through 2022.

2.2 PG&E's Distribution System Load Forecast Assumptions

PG&E's load growth forecast begins with the most recent approved California Energy Commission (CEC) PG&E Transmission Access Charge (TAC) area Peak and Energy Forecast: Mid Baseline growth forecast. Transmission-connected load growth and known new distribution loads are deducted from the CEC system load growth forecast.[4] The resultant growth is distributed out by customer class (residential, industrial, commercial, and agricultural) and is then allocated to PG&E's distribution feeders using geospatial analysis.

[4] Known new distribution loads are deducted from the system-wide forecast so that they can be added back in as local new load adjustments while maintaining consistency with the CEC forecast in aggregate.

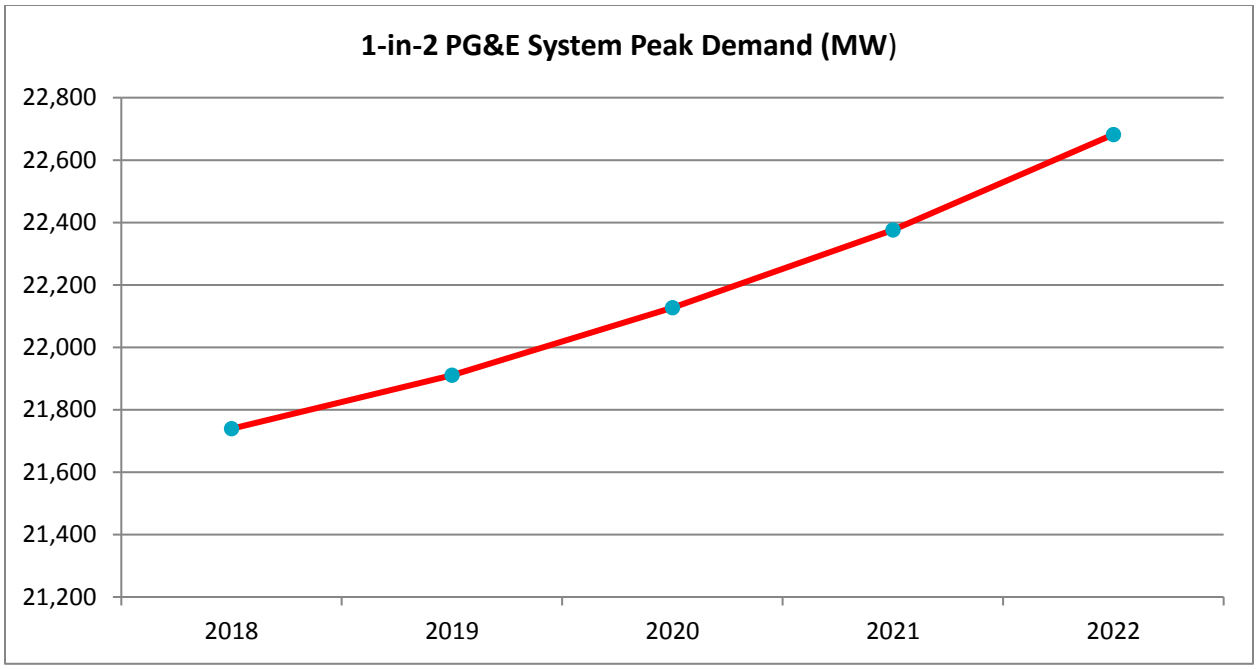

Figure 2: Total End Use Load from the CEC PGE TAC Peak and Energy Forecasts[5]

PG&E uses the LoadSEER GIS geo-spatial forecasting program, created by Integral Analytics. This program uses satellite imagery and proprietary data analytics to score each acre in PG&E's territory for the likelihood of increased load by customer class. This Geographical Information System (GIS) model also uses historical land aerial imagery to help determine expansion trends that have occurred within specific areas and takes this information into account for the acre scoring analysis. The spatial forecasting model is enhanced by utilizing an energy consumption model that is weather normalized and includes economic variables. After area scores are determined, the geospatial program then allocates the California Energy Commission (CEC) customer class load growth projections to each parcel and maps the load growth to feeders based on closest proximity. The output of the geo-spatial program is an annual PG&E peak MW growth by feeder, by customer class for the next 10 years. This growth is then uploaded into the LoadSEER forecasting program (LoadSEER FIT).

LoadSEER FIT uses customer-class load shapes to turn the system peak growth amount into a 576-hour[6] load shape that can then be applied to the feeder or bank load shape. LoadSEER FIT creates two forecasts that can be compared: 1) A geospatial forecast derived from CEC system growth and 2) a regression forecast based on multi-variable analysis and fit with historical recorded loads. LoadSEER FIT's regression methodology performs a multivariable regression to forecast the next 10 years of peak loading on distribution substation banks and

[5] CEDU 2016 Forecast Mid Baseline-Mid AAEE is used as a starting point before determining the resultant load growth for allocation. The Total End Use Load includes electric vehicle loads but does not include load reductions due to generation, energy storage, energy efficiency, and demand response.
[6] This represents hourly loads for both a typical weekday and weekend day for each month

feeders. Economic variables and temperature are compared against historic bank and feeder peak loads. With this comparison, the most relevant group of economic variables is selected for each bank and feeder. If there are no variables that have a reasonable fit, a flat, or no growth, regression is applied.

Some economic variables are only available based on local relevance. For example, a water allocation variable is available in agricultural areas south of the Sacramento Delta where peak loads are driven by agricultural pumping when low State and Federal water storage cause a severe reduction in water allocations to agricultural contracts.

PG&E uses a 1-in-10 year (90^{th} percentile of high loading) weather event forecast regression curve as the basis for making decisions regarding planned capital upgrades and permanent load transfers.

The creation of both geo-spatial load forecasts and regression forecasts provide PG&E's electric distribution planning engineers with two different yet statistically valid forecasts. If the results of both forecasts are similar, they provide PG&E's electric distribution planning engineers with greater confidence in the quality of both forecasts. Otherwise, the electric distribution planning engineers are directed to select the geo-spatial forecast results derived from CEC load forecast. If the geo-spatial forecast is not supported by historic loads and local knowledge, LoadSEER has the capability of creating a forecast that is a blend of geo-spatial and regression forecasts. Whenever a blended forecast is used, justification for the blending must be recorded in LoadSEER and approved by a PG&E senior level distribution planning engineer.

After the 10-year load forecasts are created in LoadSEER FIT, the distribution planning engineers review known new loads which are anticipated based on specific local information. These "new load adjustments" are evaluated to determine if they are covered by existing bank or feeder growth. If the new load adjustments are smaller than the forecast growth for the year that the new service application comes online, then it is assumed the forecast load for that year already embeds the new service application, and the adjustment is disabled. If the new load adjustment exceeds the growth forecast in the year planned, but does not exceed the 10-year total growth forecast, then the forecast growth is shifted forward in time to cover the new load adjustment. If a new business load is larger than the forecast 10-year growth, then the load forecast is increased to accommodate the new peak load.

As an additional step to the forecast process, PG&E's electric distribution planning engineers validate and adjust historical peak loads for distribution substation transformer banks and feeders within their local areas to establish a starting point for distribution loading projections.

The following guidelines for verifying and modifying historical loads are typically followed:

- Bank and feeder peak loads are obtained through either the SCADA historian system or monthly recorded substation metering data. Peak demand (MW) for banks as well as maximum current loading (amps) for feeders are recorded along with peak date and time.

- PG&E's electric distribution planning engineers compare recorded peak load information with adjacent days' peak load information to assess whether an unusually high or low load occurred during a planned or unplanned switching condition. Distribution Operations switching log information is reviewed to confirm the timing of the switching operations that create abnormal configurations and the feeders impacted.
- Peak loads on feeders coincident with temporary switched loads are adjusted because loading under temporary switching conditions is not relevant for forecasting normal peak loads and may lead to double-counting of loads. If a peak load is recorded after a newly executed permanent load transfer, then the previous historical loads will be automatically adjusted to maintain the present feeder configuration when analyzing historic load growth on the feeder.

Historical substation bank and feeder peak loads are adjusted, if necessary, to account for the largest distributed generation facility served by a bank or feeder being offline at peak; also known as N-1 scenario planning. Multiple generators on the same feeder may be grouped into an N-1 scenario if they have a reasonable risk of all being off-line at the same time, such as hydro facilities on the same water source.

A detailed summary of PG&E's substation bank and feeder peak demand forecasts that were utilized for this GNA are included in Appendix 4.

2.3 PG&E's Distribution System DER Growth Forecast Assumptions

Separate from load growth, PG&E has incorporated DER adoption into its distribution bank and feeder forecast assumptions. This is accomplished for residential PV, retail non-residential PV, energy efficiency for different customer classes, electric vehicles, and load modifying[7] demand response. The starting point for developing these feeder level DER growth forecasts is the CEC's California Energy Demand (CED) forecast that is completed at the system-wide level.

The CEC's CED system-wide DER forecast used by PG&E is shown in Figure 3.

[7] Load Modifying Demand Response reshapes or reduces the net load curve as opposed to Supply Resource Demand Response which is integrated into the California Independent System Operator energy markets.

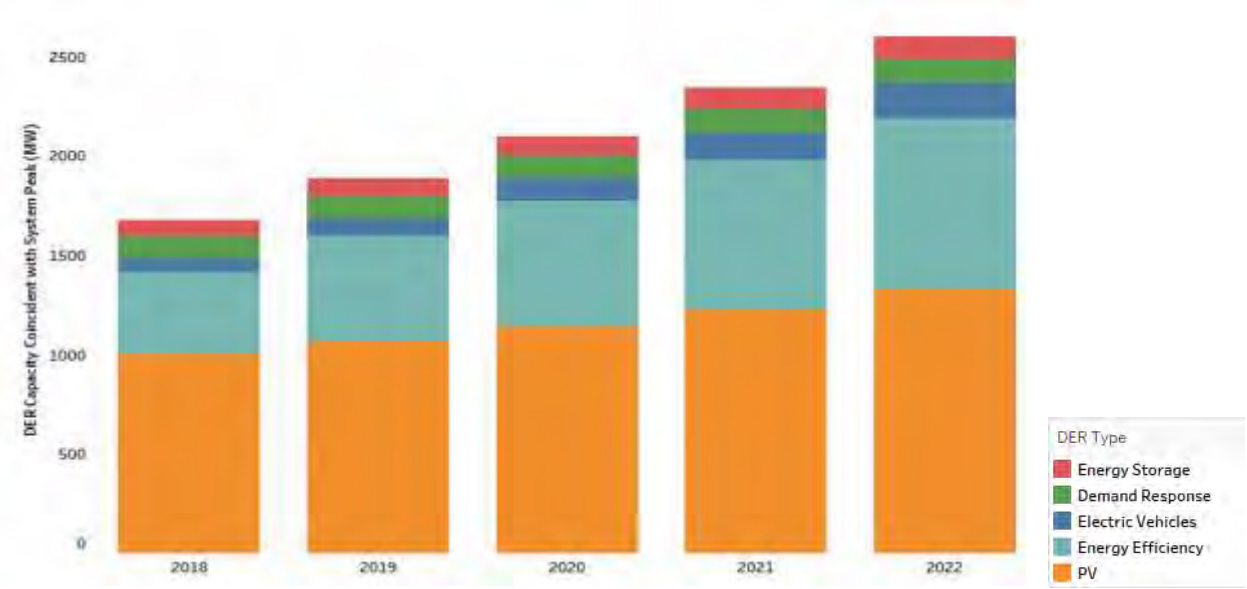

Figure 3: DER Capacity Coincident with System Peak from the CEC PGE TAC Peak and Energy Forecasts (CEDU 2016 Forecast Mid Baseline-Mid AAEE)[8]

Staying consistent with the CED forecast, the system-wide incremental MW capacity by DER technology type is allocated to the feeders based on allocation methodologies specific to the DER types. Variables used to allocate incremental DER capacity geospatially include consumption by customer class, amount of generation by feeder, historical PV adoption by zip code, the s-curve trending model, observed DG penetration level, daily peak diversity factors, weather zones, and many other factors specific for each type of DER.[9] Consistent with the Assigned Commissioner's Ruling on the adoption of Distributed Energy Resources Growth Scenarios issued August 9, 2017, PG&E's Distribution System DER Growth Assumptions utilize:

- CED Update 2016 Mid Baseline Photovoltaic Generation
- CED Update 2016 Mid Baseline Electric Vehicles
- CED Update 2016 Mid Baseline Energy Storage
- CED Update 2016 Mid Baseline Load Modifying Demand Response
- CED Update 2016 Mid Baseline-Low Additional Achievable Energy Efficiency

It is important to note that the CED Update 2016 Mid Baseline Energy Storage forecast is already included in PG&E's system-wide peak load forecast as a load reduction. Currently, PG&E does not incorporate a feeder allocation methodology for energy storage since it is still under the development.

[8] PG&E uses the DER forecasts provided in the CEDU 2016 Forecast Mid Baseline-Mid AAEE except for Energy Efficiency. The CEDU 2016 Mid Baseline-Low AAEE forecast was used instead.
[9] PG&E's DER Growth Forecast Assumptions are subject to updating and revision on an annual basis in accordance with distribution planning criteria and guidance provided by the Commission.

A detailed summary of PG&E's substation bank and feeder DER forecasts that were utilized for this GNA are included in Appendix 4.

2.4 PG&E's Load Transfers and Switching Assumptions

PG&E's 2018 GNA submittal includes the results of PG&E's electric distribution grid as a snapshot in time and does not include future planned load transfers and switching operations that will be performed. Consequently, many of the grid needs identified in the GNA can and will be mitigated by such operations rather than a planned investment. Typically, planned load transfers and switching operations are the lowest cost alternatives that take advantage of available existing "back-tie" interconnections to other distribution feeders.

PG&E may identify additional upgrades over the next several months. In this case, such upgrades will be reflected in the DDOR that will be submitted on September 1.

2.5 Grid Needs Assessment Scope

As adopted in D.18-02-004, grid needs that are reported in this GNA submittal are limited to the substation level forecast deficiencies, associated with the four distribution services that DERs can provide as adopted in D.16-12-036, which are distribution capacity, voltage support, reliability (back-tie) and resiliency. These distribution services that DERs can provide are further described in Appendix 3. For this year's GNA, identified needs were limited to substation level forecast of distribution capacity and limited reliability (back-tie) distribution grid needs for both substation transformer banks and feeders. As tools and processes are further refined and matured, PG&E plans to include more components to the GNA, such as feeder-level needs downstream of the substation.

2.6 Customer Confidentiality

In order to respect and protect customer privacy PG&E follows aggregation and anonymization rules, the primary of which is referred to as the "15/15 rule." When releasing aggregated non-residential customer usage data, the sample population must be more than 15 customers and no single customer should account for more than 15% of usage at any given time. For residential customers, the minimum requirements are at least 100 customers within the sample. Areas that do not meet these requirements will be listed in this report as "Customer Confidential."

3. Grid Needs Assessment (GNA) by Distribution Planning Regions

The PG&E distribution service area stretches from Eureka in northern California to Bakersfield in the south, and from the Pacific Ocean in the west to the Sierra Nevada in the east. It provides service to 5.4 million electric customer accounts over 106,681 circuit miles of electric distribution lines. PG&E divided the distribution service area into four geographically defined Distribution Planning Regions (DPR) for this GNA. These regions are: 1) Bay Area, 2) Central Coast, 3) Central Valley and 4) Northern. Each region aggregates a collection of PG&E operating divisions, as indicated in the DPR area descriptions.

For brevity, a summary of grid needs in each region is included in the following sections. As discussed, these needs may be addressed by a distribution switching/load transfer solution, planned facility re-rate or a planned investment, which are not modeled in this GNA.

A detailed summary of PG&E's 2018 Grid Needs Assessment results, peak demand and DER growth forecasts down to the Substation Bank and Feeder are included in Appendix 4.

3.1 Grid Needs in the Bay Area DPR

3.1.1 Area Description

The Bay Area DPR covers approximately 2,145 square miles in the center of PG&E's service territory, as shown in the highlighted area of the adjacent figure. Some of the counties that are served in this area include Alameda, Contra Costa, San Francisco, Napa, Marin, Solano, and Sonoma. There are 4 planning divisions in the Bay Area, which are Diablo, East Bay, North Bay, and San Francisco.

Figure 4: Bay Area DPR

General issues for the Bay Area DPR in the past include

- substation upgrades to improve operating flexibilities,
- substation transformer replacements,
- system upgrades for new generation interconnections,
- and emergency bank and circuit capability at certain substations.

San Francisco, overall, has many highly sensitive customers extremely concerned with service reliability.
The downtown areas in the Bay Area DPR such as San Francisco, Oakland and Walnut Creek have been going through a major revitalization and redevelopment with new commercial high-rise buildings, hotels and multi-level residential developments. There is significant load growth

anticipated in the former Oakland Army Base area adjacent to the Port of Oakland. There is also a substantial amount of new commercial and residential loads expected at the former Concord Naval Weapons Station in Contra Costa County. The Bay Area DPR load is perceived to be highly concentrated commercial and residential loads within a relatively small footprint. That may change in the future as there is a considerable amount of load growth anticipated by EV charging stations.

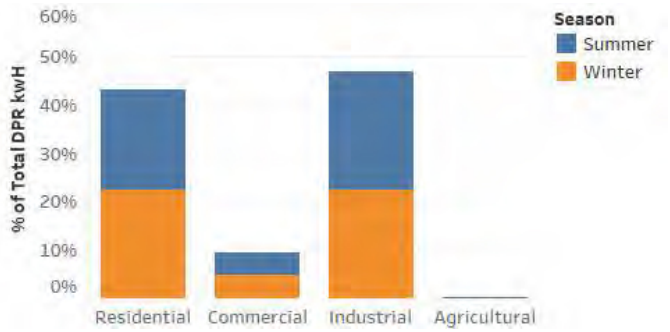

Figure 5: Bay Area DPR Consumption Breakout by Customer Type

The Bay Area DPR's distribution grid is comprised of 659 distribution circuits supplied by a total number of 242 substations. The circuits are extended with 11,000 circuit miles in which 31.5% is overhead poly-phase circuit, 20.9% overhead single phase, 31.4% underground poly-phase, and 16.2% underground single phase.

The Bay Area DPR serves approximately 1.3 million customers, of which 0.2% are agricultural, 7.4% are commercial, 2.3% are industrial, and 90.2% are residential. The total peak demand of circuits in the Bay Area is projected to be 4,453 MW in 2018. In 2022, it is forecast to be 4,445 MW.

The Bay Area DPR has a total of 549 MW of existing DG nameplate capacity, of which 81.3% is inverter based. Currently 35 circuits are considered "High Penetration". These are circuits with interconnected nameplate generation of more than 30% of the circuit peak load.

Figure 6: Bay Area DPR High Penetration Circuit Counts Over the Past 4 Years

3.1.2 Assessment Summary

Sixteen banks and 28 feeders in the Bay Area DPR have identified deficiencies. Over 70% of the feeders with deficiencies (22 out of 28 feeders) primarily serve residential customers. That is, residential customer accounts make up more than 50% of the feeder service in 70% of the feeder deficiency cases. Table 1 provides specifics for the grid needs identified in the Bay Area DPR.

Table 1: Summary of Grid Needs Assessment for the Bay Area DPR

3.2 Grid Needs in the Central Coast DPR

3.2.1 Area Description

Figure 7: Central Coast DPR

The Central Coast DPR covers approximately 11,900 square miles south of San Francisco Bay, extending along the central California coast from Santa Cruz to King City, as shown in the highlighted area of Figure 7. Northern California's largest city, San Jose, is within this planning region, as is the center of California's thriving technology sector: Silicon Valley. Some of the counties that are served in this area include Santa Cruz, Monterey, San Benito, San Luis Obispo and Santa Barbara. There are 6 planning divisions in the Central Coast area, which are Central Coast, De Anza, Los Padres, Mission, Peninsula, and San Jose.

There is a profound diversity in the customer base in the area, from high-tech to oil extraction to tourism. Voltage fluctuations and momentary outages are critical issues to the high technology and biotechnology customers concentrated in this DPR. Agriculture in the Central Coast DPR historically was limited to row crops and vineyards, but now includes food processing and packaging all of which have higher energy demand. Petroleum extraction is concentrated in the southern area of Monterey County and the northern area of Santa Barbara County.

In general, this area is highly temperature-sensitive. Weather dependent air conditioning loads substantially vary from year to year. New load in the Central Coast DPR typically falls into six categories: EV charging stations, biotechnology, technology offices/campuses, data centers, and public infrastructure projects. Public infrastructure projects include schools, universities, hospitals, water treatment plants (including desalination), sewer treatment plants, and transportation. Existing distribution infrastructure may be inadequate in rural areas to serve large new loads, potentially requiring improvements to existing bank and feeder capacity.

General issues for the Central Coast DPR include:

- emergency bank and circuit capability at certain substations,
- substation upgrades to improve operating flexibility,
- exposure to winter storms,
- substation capacity upgrades,
- and aging transformers requiring replacements.

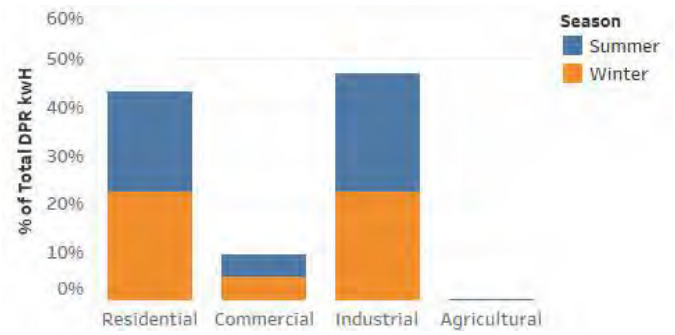

Figure 8: Central Coast DPR Consumption Breakout by Customer Type

The Central Coast DPR's distribution grid is comprised of 876 distribution circuits supplied by a total number of 347 substations. The circuits are extended with 24,000 miles of line, in which 39.1% is overhead poly-phase circuit, 24.9% overhead single phase, 23.2% underground poly-phase, and 12.9% underground single phase.

The Central Coast DPR serves a total number of 1.9 million customers, in which 0.6% are agricultural, 7.8% are commercial, 2.7% are industrial, and 88.9% are residential. The peak demand of all circuits in 2018 for the Central Coast DPR is projected to be 7,096 MW. For 2022, this is forecast to be 7,128 MW.

The Central Coast DPR has a total of 873 MW of existing DG nameplate capacity, with the majority being inverter based DG capacity at 92.7%. Currently 62 circuits are considered "High Penetration". These are circuits for which their interconnected nameplate generation is more than 30% of the circuit peak load.

Figure 9: Central Coast DPR High Penetration Circuit Counts Over the Past 4 Years

3.2.2 Assessment Summary

Thirty-nine banks and 55 feeders in the Central Coast DPR have specified deficiencies. Over 70% of the feeders with deficiencies (41 out of 55 feeders) primarily serve residential customers. That is, residential customer accounts make up more than 50% of the feeder service in 70% of the feeder deficiency cases. Table 2 provides specifics for the grid needs identified in the Central Coast DPR.

3.3 Grid Needs in the Central Valley DPR

3.3.1 Area Description

The Central Valley DPR covers approximately 25,000 square miles in north central California. This service area extends to the Diablo Range section of the Pacific Coast Ranges in the east and the Sierra Nevada range in the west; from the City of Stockton in the north to the Tehachapi Mountains in the south. The Central Valley DPR includes the counties of Alpine, Amador, Calaveras, Fresno, Kings, Kern, Madera, Mariposa, Merced, San Joaquin, San Luis Obispo, Santa Barbara, Stanislaus, Tulare, and Tuolumne. Larger cities in this region include Bakersfield, Clovis, Fresno, Los Banos, Madera, Manteca, Merced, and Stockton. There are four planning divisions within the Central Valley DPR: Fresno, Kern, Stockton, and Yosemite.

Figure 10: Central Valley DPR

The Central Valley DPR encompasses rich agricultural lands, with a significant portion of the customer base and economy involved in a wide variety of crop production and post-harvest processing. Other industries include construction, healthcare, services, and petroleum extraction along the Coast Range and in Kern County.

The Central Valley DPR experiences high ambient temperatures throughout the summer months, with substantial air conditioning loads between May and October. Agricultural irrigation pumping loads are highly variable based on United States Bureau of Reclamation water allocations. The California drought during the years 2012-2016 triggered significant increases in new well pump applications. The recovery of the economy in the Central Valley has brought renewed residential and commercial construction activity.

The Central Valley is experiencing industrial growth in the form of distribution centers and warehousing, as well as electric vehicle (EV) charging infrastructure, both along transportation corridors. More long term, the California High Speed Rail will open its Initial operating segment in the central San Joaquin Valley, which will likely spur growth and revitalization along the railway corridor.

General issues for the Central Valley DPR in the past include:

- high number of generation interconnection projects,
- radial 60/70 kV Systems and Lines,
- varying agricultural pumping demand from year to year,

- rural substations with long circuit ties in agricultural and foothill areas,
- substation capacity upgrades required to meet demand,
- certain substation transformers replacement due to age and condition,
- winter storms in mountainous terrain of the Sierras,
- and emergency bank and circuit capability at certain substations.

The Central Valley DPR's distribution grid is comprised of 910 distribution circuits supplied by a total number of 368 substations. The circuits are extended with 38,000 miles of circuits, in which 65% is overhead poly-phase circuit, 17.8% overhead single phase, 9.2% underground poly-phase, and 8% underground single phase.

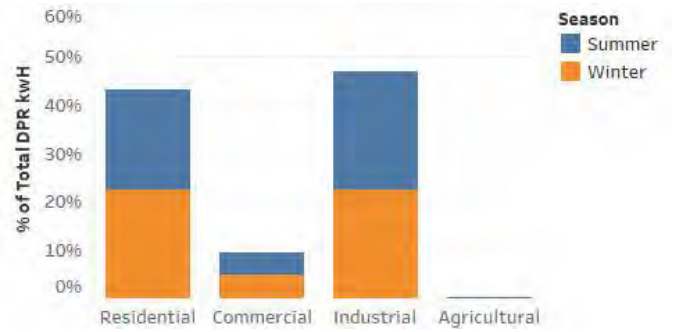

Figure 11: Central Valley Consumption Breakout by Customer Type

The Central Valley DPR serves a total number of 1.2 million customers, in which 5% are agricultural, 8.7% are commercial, 2.6% are industrial, and 83.7 % are residential. The peak demand of all the circuits in the Central Valley DPR is projected to be 7,378 MW in 2018. In 2022, this is forecast to be 7,566 MW.

The Central Valley DPR has a total of 1,541 MW of existing DG nameplate capacity, with the majority being inverter based DG capacity at 92%. Currently 169 circuits are considered "High Penetration". These are circuits for which their interconnected nameplate generation is more than 30% of the circuit peak load.

Figure 12: Central Valley High Penetration Circuit Counts Over the Past 4 Years

3.3.2 Assessment Summary

Thirty-Six Central Valley DPR banks and 78 feeders have specified deficiencies that require mitigation. Nearly 90% of the feeders with deficiencies (69 out of 78 feeders) primarily serve residential customers. That is, residential customer accounts make up more than 50% of the

feeder service in nearly 90% of the feeder deficiency cases. Table 3 provides specifics for the grid needs identified in the Central Valley DPR.

Table 3: Summary of Grid Needs Assessment for Central Valley DPR

3.4 Grid Needs in the Northern DPR

3.4.1 Area Description

The Northern DPR covers approximately 33,770 square miles forming the northern portion of PG&E's service territory. This service area extends to the Pacific Coast in the west to the Sierra foothills in the east, from the California-Oregon border in the north and south as far as the Central Valley and Bay Area DPRs, as shown in the highlighted area of the adjacent figure. Counties served in this area include Butte, Colusa, Contra Costa, Del Norte, El Dorado, Glenn, Humboldt, Lake, Lassen, Mendocino, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Siskiyou, Solano, Sonoma, Sutter, Tehama, Trinity, Yolo, and Yuba. Larger cities in this region include Sacramento, Santa Rosa, Eureka, Fairfield, Redding, Vacaville and Vallejo. There are five planning divisions in the Northern Region: Humboldt, North Valley, Sacramento, Sierra, and Sonoma.

Figure 13: Northern DPR

The customer base in this DPR reflects significant diversity, ranging from ski resorts to wineries to large industrial customers. The largest industrial customers represent the building and specialty materials industry, cement and plastic manufacturing. The Napa Valley, including in Napa and Sonoma Counties, is renowned for its many fine wineries. Agriculture, apart from vineyards, also is primary economic driver in the north northern San Joaquin Valley with its numerous rice producers and nut growers. Historically, agriculture in this area was limited to row crops, rice and vineyards, food processing/packaging, and related agricultural industries such as nut hulling and fiberboard fabrication. Ski resorts drive the peak loads in the high Sierra. The City of Sacramento as the state capital with its associated governmental agencies drives the local economy. Although PG&E does not provide electric service to Sacramento County, the influence of California State government has significant impact the surrounding counties.

Some DER growth has occurred in this DPR, particularly with residential customers adding PV. EV charging stations are being added along highways and in urban areas. Energy storage is not very prevalent in this area, but the Northern region has 2 MW of battery storage at Vaca Dixon Substation and a 500 kW battery at Browns Valley Substation. More battery installations are expected to occur as installation costs decrease.

In general, this area is highly temperature and rainfall sensitive, with temperature driving the air conditioning loads and (lack of) rainfall driving the need for large agricultural pumps. These loads vary dramatically from year to year, depending on the weather. Generally, new loads in the Northern DPR are of six types: EV charging stations, agricultural processing, orchards,

residential developments, and public infrastructure projects. Public infrastructure projects include schools, universities, hospitals, water treatment plants (including desalination), sewer treatment plants, and transportation. In rural areas, existing infrastructure may be inadequate to serve large new loads, resulting in projects to improve existing bank and feeder capacity.

General issues for the Northern DPR in the past include:

- varying agricultural pumping demand from year to year,
- rural substation with long circuit ties in agricultural and foothill areas,
- generator interconnection projects coming online,
- substation capacity upgrades required to meet demands,
- certain substation transformers need replacements,
- winter storms along the coastal areas as well as the mountainous terrain in the Sierra's,
- and emergency bank and circuit capability at certain substations.

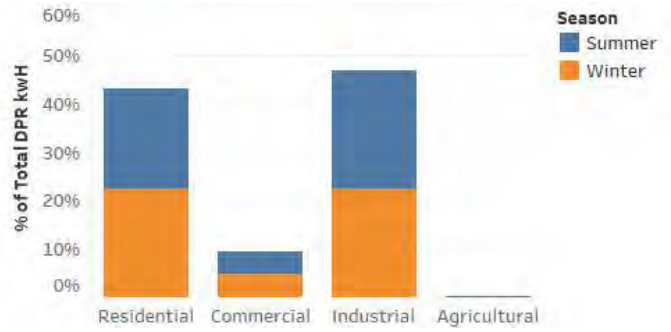

Figure 14: Northern DPR Consumption Breakout by Customer Type

The Northern DPR's distribution grid is comprised of 649 circuits supplied by a total number of 338 substations. The circuits are extended with 34,000 miles of lines, in which 47.5% is overhead poly-phase circuit, 36% overhead single phase, 9.6% underground poly-phase, and 6.9% underground single phase.

The Northern DPR serves a total number of 1.1 million customers, in which 2.2% are agricultural, 9.7% commercial, 2.3% industrial, and 85.8% residential. The peak demand of all circuits in the Northern area is projected to be 4,615 MW in 2018. For 2022, this is forecast to be 4,568 MW.

The Northern DPR has a total of 870 MW of existing DG nameplate capacity, with the majority being inverter based DG capacity at 89.1%. Currently 111 circuits are considered "High Penetration". These are circuits for which their interconnected nameplate generation is more than 30% of the circuit peak load.

Figure 15: Northern DPR High Penetration Circuit Counts Ove the Past 4 Years

3.4.2 Assessment Summary

Thirty banks and 32 feeders have specified deficiencies that require mitigation. Over 90% of the feeders with deficiencies (30 out of 32 feeders) primarily serve residential customers. That is, residential customer accounts make up more than 50% of the feeder service in nearly 90% of the feeder deficiency cases. Table 4 provides specifics for the grid needs identified in the Northern DPR.

Table 4: Summary of Grid Needs Assessment for Northern DPR

Division	Facility Type	Facility Name	Primary Driver	Distribution Service Required	Anticipated Need Date	Year 2018 (%)	Year 2019 (%)	Year 2020 (%)	Year 2021 (%)	Year 2022 (%)

Appendix 1: Datasets Guide

This section is a guide on using the GNA datasets including how to interpret what the fields mean and what certain values mean. The data package for the 2018 GNA includes:

- Demand Forecast Data from 2018 to 2022
- DER Growth Forecast Data from 2018 to 2022
- Grid Needs Assessment Data from 2018 to 2022

Any interested party can access the data through PG&E web maps by using the following link:

https://www.pge.com/en_US/for-our-business-partners/energy-supply/solar-photovoltaic-and-renewable-auction-mechanism-program-map/solar-photovoltaic-and-renewable-auction-mechanism-program-map.page

Demand Forecast Data

This data shows the forecast 1-in-10 year peak loads for substation banks and feeders across PG&E's territory.

Interpreting the Fields:

- Division: the distribution planning division where the bank or feeder is located
- Facility Type: bank or feeder
- Facility Name: the name for the bank or feeder
- Peak Load: the forecast 1-in-10 year weather net peak loads under normal operating conditions

Key points:

- Feeders with single customers, large dedicated distributed generation, identified as tie cables, or identified as idle feeders do not have load projections and were therefore filtered out of the final list of banks and feeders.
- Banks and feeders with peak loads listed as "CUSTOMER CONFIDENTIAL" were redacted due to their peak loads violating the 15-15 customer privacy rule. A 15-15 violation occurs if the load is comprised of less than 15 customers or a single customer contributes to more than 15% of the loading value.

DER Growth Forecast Data

This data provides the trajectory DER growth forecast applied for each feeder for the entire PG&E territory and broken out by DER type. These forecast values do not include existing DER capacity but do show incremental DER growth starting in 2018 and continuing until 2022.

Interpreting the Fields:

- Division: the distribution planning division where the feeder is located

- Bank Name: the name of the bank providing power to the feeder for which a DER Growth forecast is provided
- Feeder Name: the name of the feeder for which a DER Growth forecast is provided
- Load Modifying Demand Response (LMDRDR): Demand Response that can be dispatched by PG&E, as opposed to that which can be dispatched by the California Independent System Operator.is. Negative values translate into load reduction
- Additional Achievable Energy Efficiency (AAEEEE) AGR: the largest coincidental load reduction, in MW, from agricultural customers adopting EE. Negative values translate into load reduction
- Additional Achievable Energy Efficiency (AAEEEE) COM: the largest coincidental load reduction, in MW, from commercial customers adopting EE. Negative values translate into load reduction
- Additional Achievable Energy Efficiency (AAEEEE) DOM: the largest coincidental load reduction, in MW, from residential customers adopting EE. Negative values translate into load reduction
- Additional Achievable Energy Efficiency (AAEEEE) DOM: the largest coincidental load reduction, in MW, from industrial customers adopting EE. Negative values translate into load reduction
- Electric Vehicles (EV): the largest coincidental load increase, in MW, from electric vehicle loads. Positive values translate into a load increase
- Residential PV: the largest coincidental load decrease, in MW, from residential retail PV. Negative values translate into a load decrease
- Non-Residential PV: the largest coincidental load decrease, in MW, from non-residential retail PV. Negative values translate into a load decrease

Grid Needs Assessment Data

This data shows the forecasted grid needs for substation banks and feeders across PG&E's territory and is divided into two sections. The first section, "GNA Results", shows the forecast grid needs for which the 1-in-10 year weather peak loads for substation banks and feeders are compared to the normal operating equipment ratings for these assets. The second section, "GNA Other" shows forecast grid needs which do not fall into the previous category. Interpreting the Fields for the GNA Results:

- Division: the distribution planning division where the bank or feeder is located
- Facility Type: bank or feeder
- Facility Name: the name for the bank or feeder
- Primary Driver: the primary driver of the grid need if one exists.
- Distribution Service Required: the distribution service for which the grid need can mapped to. This can be in the form of Capacity, Voltage Support, Reliability(Back-tie), and Resiliency

- Anticipated Need Date: the date for which the grid need is estimated to first occur if there is one
- Facility Rating (MW): the normal operating rating of the asset.
- Facility Loading (%): Peak Load/Facility Rating x 100%.

Interpreting the Fields for the GNA Other:

- Division: the distribution planning division where the bank or feeder is located
- Facility Type: bank or feeder
- Facility Name: the name for the bank or feeder
- Primary Driver: the primary driver of the grid need if one exists
- Distribution Service Required: the distribution service for which the grid need can mapped to. This can be in the form of Capacity, Voltage Support, Reliability(Back-tie), and Resiliency
- Anticipated Need Date: the date for which the grid need is estimated to first occur if there is one
- Deficiency: MW deficiency related to Emergency Bank Loss or violated criteria related to other grid needs.

Key points:

- Feeders with single customers, large dedicated distributed generation, identified as tie cables, or identified as idle feeders do not have load projections and were therefore filtered out of the final list of banks and feeders.
- Banks and feeders with percent loads, and equipment ratings listed as “CUSTOMER CONFIDENTIAL” were redacted due to their peak loads violating PG&E’s adoption of the 15-15 customer privacy rule. A 15-15 violation occurs if the load is comprised of less than 15 customers or a single customer contributes to more than 15% of the loading value.

Appendix 2: Map Guide

To assist stakeholders with identifying areas of forecasted grid needs, projected load growth, and projected DER growth, online maps have been developed by PG&E. Any interested party can access these web maps by using the following link:

https://www.pge.com/en_US/for-our-business-partners/energy-supply/solar-photovoltaic-and-renewable-auction-mechanism-program-map/solar-photovoltaic-and-renewable-auction-mechanism-program-map.page

These web maps are organized into three distinct layers:

- Demand Forecast Data from 2018 to 2022
- Grid Needs Assessment Data from 2018 to 2022
- DER Growth Forecast Data from 2018 to 2022

Demand Forecast Layer

For the Demand Forecast Layer, users can toggle between two sub-layers:

1. Substation Demand Forecast Layer:
   This layer provides a heat map of polygons where each polygon covers the approximate geographic area serviced by a specific substation and colored in Red-Amber-Green based on the ratio of substation bank loading to the bank's Summer Normal Operating Capacity. An orange or red polygon will point out a highly loaded bank while green will point out a lightly loaded bank. Since there can be multiple banks serving a substation area as well as multiple load forecasting years, these substation polygons are colored based on the highest loaded year for the highest loaded bank. When a substation polygon is selected, the user can cycle through each of the substation banks in that polygon to see their respective Demand Forecast data as well as a hyperlink to the overall GNA dataset download:

   - Facility Type
   - Bank Name
   - Year 2018 Peak Load
   - Year 2019 Peak Load
   - Year 2020 Peak Load
   - Year 2021 Peak Load
   - Year 2022 Peak Load

2. Feeder Demand Forecast Layer:
   This layer provides the user with the optionality to toggle between a heat map of polygons where each polygon covers the approximate geographic area serviced by a specific feeder and a heat map of distribution primary circuit lines where the circuit lines cover the approximate geographic area serviced by a specific feeder. Each view has its specific advantages. With the polygon view, it is easier to distinguish feeders from a

zoomed-out view while circuit lines are useful for distinguishing feeders in dense urban areas where there is excessive overlap between polygons. Regardless of the view, this layer is colored in Red-Amber-Green based on the ratio of the feeder outlet loading to the feeder outlet's Summer Normal Operating Capacity. An orange or red polygon will point out a highly loaded feeder while green will point out a lightly loaded feeder. Since there are multiple load forecasting years, this layer is colored based on the highest loaded year. When a feeder polygon is selected, the user can see its respective Demand Forecast data as well as a hyperlink to the overall GNA dataset download:

- Facility Type
- Feeder Name
- Year 2018 Peak Load
- Year 2019 Peak Load
- Year 2020 Peak Load
- Year 2021 Peak Load
- Year 2022 Peak Load

Note:

- Banks and feeders with peak loads listed as "CUSTOMER CONFIDENTIAL" will have blacked out map polygons and lines. If all banks in a substation are listed as customer confidential, the substation polygon is blacked out.

DER Growth Forecast Layer

The DER Growth Forecast Layer provides the map user with the choice to toggle between a colored map of feeder polygons and a colored map of distribution primary circuit lines like the feeder polygons and circuit lines discussed in the previous section.

The colors of these feeder elements are based on the values resulting from the following calculation. For each feeder, the forecasted incremental increase to DER peak capacity between 2017 and 2022 is calculated for each DER technology type. These calculated values are then summed for each feeder, which determines the feeder shape color. In other words, these feeder shapes are colored based on the non-coincidental increase to DER peak capacity between 2017 and 2022. Once these values have been determined, the shape colors are assigned based on a ranking of these values with the lowest third of the values getting blue, the middle third getting green, and the highest third getting orange. When a feeder polygon is selected, the user can see its respective DER Growth Forecast data as well as a hyperlink to the overall GNA dataset download:

- Bank Name
- Feeder Name
- Demand Response (MW)
- Energy Efficiency (MW)

- Electric Vehicles (MW)
- PV (MW)

Grid Needs Assessment Layer

The user will see that the Grid Needs Assessment Layer closely resembles the Demand Forecast Layer due to most of the grid needs in the 2018 iteration of the GNA falling into the Distribution Capacity category of grid needs. For the GNA Layer, users can toggle between two sub-layers:

1. Substation Demand Forecast Layer:
This layer provides a heat map of polygons where each polygon covers the approximate geographic area serviced by a specific substation and is colored in Red-Amber-Green based on the ratio of the magnitude of grid need to the relevant equipment rating associated with that grid need. An orange or red polygon will point out the existence of a grid need while green will point out that there is no existing grid need in the substation. Since there can be multiple banks serving a substation area as well as multiple load forecasting years, these substation polygons are colored based on the highest grid need year for the bank with the highest ratio of grid need magnitude to equipment rating. When a substation polygon is selected, the user can cycle through each of the substation banks in that polygon to see their respective Grid Needs data:

    - Facility Type
    - Bank Name
    - Primary Driver
    - Distribution Service Required
    - Anticipated Need Date
    - Facility Rating (MW)
    - Year 2018 Facility Percent Loading
    - Year 2019 Facility Percent Loading
    - Year 2020 Facility Percent Loading
    - Year 2021 Facility Percent Loading
    - Year 2022 Facility Percent Loading

    A hyperlink to the overall GNA dataset download is also provided.

2. Feeder Demand Forecast Layer:
This layer provides the user with the optionality to toggle between a heat map of polygons where each polygon covers the approximate geographic area serviced by a specific feeder and a heat map of distribution primary circuit lines where the circuit lines cover the approximate geographic area serviced by a specific feeder. Each view has its specific advantages. With the polygon view, it is easier to distinguish feeders from a zoomed-out view while circuit lines are useful for distinguishing feeders in dense urban

areas where there is excessive overlap between polygons. Regardless of the view, this layer is colored in Red-Amber-Green based on the ratio of the feeder outlet's magnitude of grid need to the feeder outlet's equipment rating associated with that grid need. An orange or red polygon will point out the existence of a grid need while green will point out that there is no existing grid need on that feeder. Since there are multiple load forecasting years, this layer is colored based on the highest grid need year. When a feeder polygon is selected, the user can cycle through its respective Grid Needs data:

- Name of Bank Serving Feeder
- Facility Type
- Feeder Name
- Primary Driver
- Distribution Service Required
- Anticipated Need Date
- Facility Rating (MW)
- Year 2018 Facility Percent Loading
- Year 2019 Facility Percent Loading
- Year 2020 Facility Percent Loading
- Year 2021 Facility Percent Loading
- Year 2022 Facility Percent Loading

A hyperlink to the overall GNA dataset download is also provided.

Note:

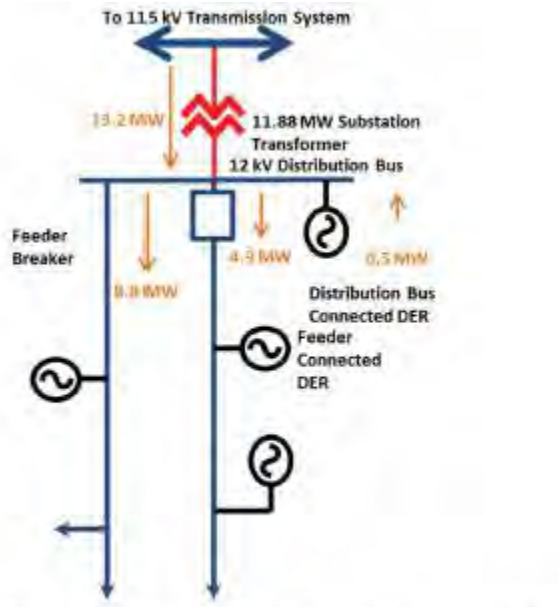
- Banks and feeders with peak loads listed as "CUSTOMER CONFIDENTIAL" will have blacked out map polygons and lines. If all banks in a substation are listed as customer confidential, the substation polygon is blacked out.

Appendix 3: Examples of Grid Needs and Associated DER Services

The following examples are based on the Competitive Solicitation Framework Working Group Final Report Filed by the Joint California Investor Own Utilities (August 1, 2016).

Example A: Distribution Capacity Services

Electric Distribution Planning analysis has identified that a distribution substation transformer is projected to overload in year 2019 during summer peak demand conditions. Specifically, after possible transfers have been completed, this distribution substation transformer is projected to serve a peak demand of 13.2 MW, which exceeds this transformer's thermal capacity rating of 11.88 MW by 11%. Hence, this transformer is projected to overload by 11% under these peak demand conditions. Furthermore, additional Distribution Planning analysis has projected that this overload may reach up to 22% by year 2020 for summer peak demand conditions. The following schematic illustrates this example.



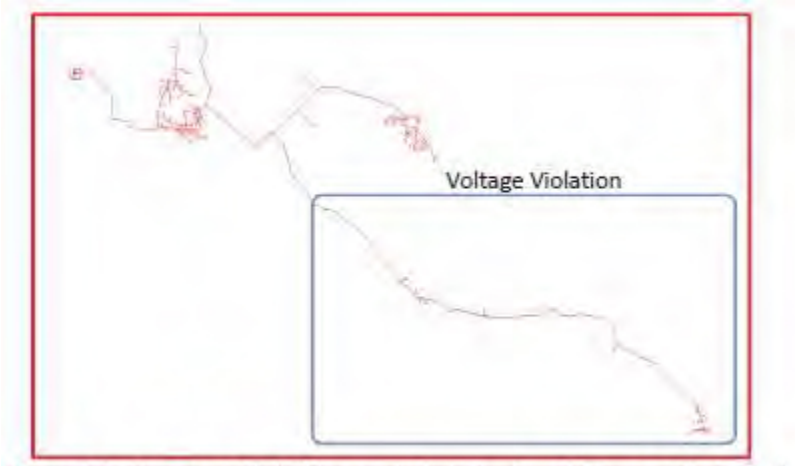
Example of Projected Substation Transformer Overload

To ensure safe and reliable electric service, additional distribution capacity is required for this transformer. This additional capacity can be achieved through a traditional "wires" alternative, which in this case would be the addition of a new substation transformer, or via a DER alternative that effectively reduces this transformer's net loading to be within its thermal rating.

Example B: Voltage Support Service

Electric Distribution Planning utilizes modeling tools to perform power-flow studies of the distribution system simulating electric grid performance. The loading values input for each distribution feeder are based on forecast values. The 2016 results from the power flow identified

a feeder with steady-state voltage below the CPUC Rule 2 limit at specific sections on a highly residential feeder. The area in question is also forecast to incur future residential development in the next several years increasing the demand and reducing the voltage further. The following schematic identifies the distribution feeder forecast to have voltage violations during peak conditions.

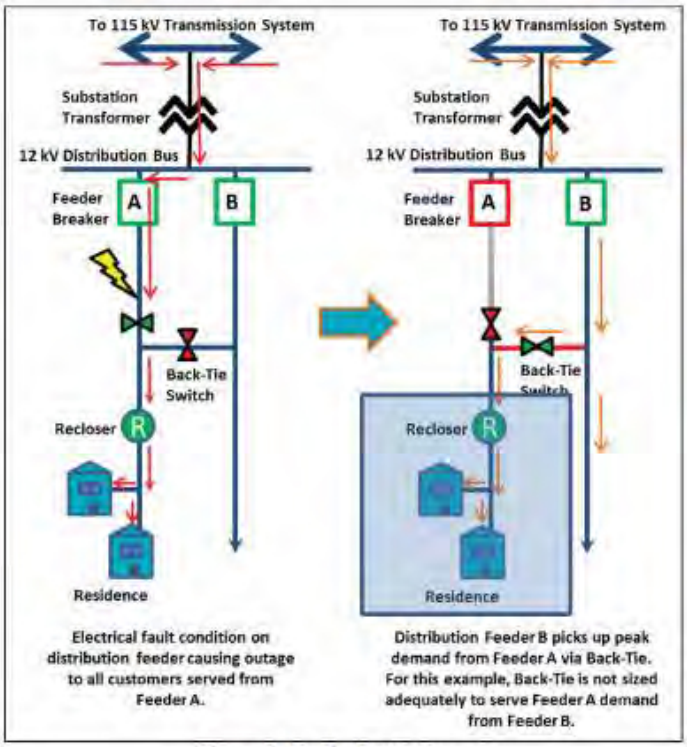


Example B - Location within Blue square Depicts where DERs are to be located

To ensure safe and reliable electric service as well as maintaining compliance with CPUC Rule 2 voltage limits, additional reactive resources are required. A traditional “wires” solution to provide additional reactive resources is installing a switched capacitor on the feeder or installing a voltage regulator. Another alternative is interconnecting DERs to provide reactive resources effectively acting as a capacitor either when requested by the utility or provided with a required operating profile. The DER reactive resource could be from an individual resource and/or aggregated resources capable of dynamically and demonstrably providing reactive power.

Example C: Reliability Services – Back-Tie

Electric Distribution Planning analysis has identified that a distribution feeder is projected to overload by year 2018 under emergency conditions when providing back-tie capacity support to an adjacent distribution feeder that has an experienced an outage. Specifically, the distribution feeder back-tie is not sized appropriately to transfer peak demand from the de-energized distribution feeder to an adjacent distribution feeder. The following figure illustrates this example.

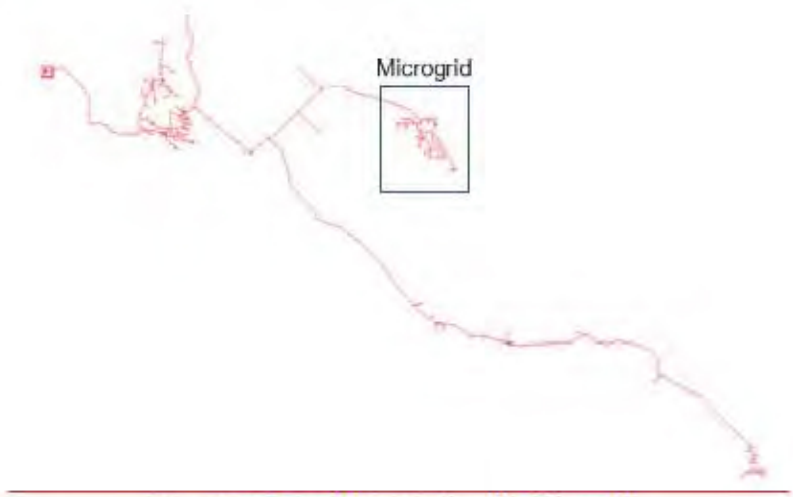


Example C: Back-Tie Capacity

To ensure safe and reliable electric service as well as maintaining compliance with the CPUC Rule 2 voltage limits, additional DER resources may provide additional reliability via incremental back-tie capacity support following distribution feeder outage conditions. A traditional “wires” solution to provide this additional reliability service is to reinforce this back-tie with higher rated infrastructure, which could include larger size electrical line conductors and higher rated back-tie switches. Another alternative is interconnecting and operating DERs to provide resources to restore service to customers either when requested by the utility or provided when a forced outage occurs and incremental back-tie support is needed to serve electric customers from an adjacent feeder. The DER resources could be from an individual resource and/or aggregated resources capable of dynamically and demonstrably providing the electrical services to customers.

Example D: Reliability Services – Resiliency

Electric Distribution Planning utilizes modeling tools to perform power-flow studies of the distribution system simulating electric grid performance. The loading values inputted for each distribution feeder are based on forecast values. Under normal operating scenarios customers are provided electric service that meets Rule 2 levels of service, voltage range of 105% to 95% of nominal 120 V, with frequency typically in the range of 60 +- 0.1 Hz. When a forced or a planned outage occurs, customers will experience a loss of electrical service. If the outage occurs upstream of a sectionalizing device and there is a downstream open circuit tie as discussed in Reliability: Backup Capability, then the upstream device is opened, the downstream ties switch is closed and service is restored to customers on the non-faulted areas of the feeder.



Example of a Distribution Feeder with a Microgrid

Thus, a traditional “wires” solution to provide resiliency for a defined subset of customers is to provide an alternative feed to the customers who would be impacted by an outage. Another alternative is interconnecting DERs to provide resources to restore service to customers either when requested by the utility or provided when a forced outage occurs on the feeder upstream. The DER resources could be from an individual resource and/or aggregated resources capable of dynamically and demonstrably providing the electrical services to customers. The generation resources must be capable of operating in isochronous mode and must have associated controls to match generation to load while maintaining voltage, frequency, and power factor and power quality within appropriate limits.

Appendix 4

Distribution Resources Plan Grid Needs Assessment

Date
01 June 2018

Description

The objective of the GNA is to provide transparency into the assumptions and results of the distribution planning process that yield the candidate deferral shortlist, proposed grid modernization investments, and proactive hosting capacity upgrades proposed to accommodate forecast autonomous distributed energy resource (DER) growth. PG&E's initial GNA presents preliminary data available regarding PG&E's projected distribution grid needs over a five-year planning horizon. A full GNA will be provided in 2019. This initial GNA will allow DRP stakeholders an opportunity to gain familiarity with PG&E's projected distribution grid needs, in advance of future solicitations for distribution deferral opportunities. As this is the first annual GNA delivered, PG&E anticipates refinement and evolution of the methods and processes used in developing the GNA to occur over time in response to stakeholder and Commission feedback. As an example, PG&E anticipates the GNA and DDOR will be used to develop inputs to the Integrated Resource Plan's long-term resource plan optimization; however, the specific data needs associated with this use case have not yet determined.
PG&E notes also that the information in this GNA represents PG&E's best information currently available on its electric distribution system, and is subject to change, including updates based on changes in forecast system and local loads; priorities for emergent work on electric distribution facilities generally; and the results of PG&E's rate cases, including the upcoming 2020 General Rate Case.

Important Notes

PG&E has a responsibility to protect the data privacy of our customers. When releasing data that would violate a customer's privacy or customer's trade secrets, this data is replaced with "CUSTOMER CONFIDENTIAL." See the GNA report for more information on the rules followed to determine when information is confidential.

Tabs

Demand Forecast	Forecast 1-in-10 year peak loads for PG&E substation banks and feeders
